First Out The Door, First On The Scene  
Toyne™ introduces the all-new Priority Response Vehicle™

BREDA, Iowa, (July 14, 2015) – Designed for the specific needs of each fire department, the Toyne Priority Response Vehicle (PRV™) has been engineered to handle the work of multiple apparatus. Knowing that the pump panel is an integral part of a fire apparatus, Toyne has developed the PRV to utilize an innovative enclosed slide out and down pump panel which takes up less space, allowing departments to choose their pump panel location and choose from multiple body configurations.

Since the enclosed pump panel can be placed on either the rear, driver, officer or even inside the cab of the apparatus, fire departments can keep the controls close at hand while Toyne Tailored storage options maximize every square inch of space. Toyne's PRV not only provides ample storage and the best pump maintenance access in the industry, it can maneuver into even the most remote locations with ease.

Due to its compact size and shorter wheelbase, the PRV boasts the tightest turning radius and cramp angles in the industry. "We've designed the PRV to be the first apparatus out the door and first on the scene," said Toyne product support coordinator, Bill Bird. "Whether you are responding to a fire or rescue call, our Priority Response Vehicle is equipped to carry the tools you need for any situation."

Toyne debuted their latest emergency vehicle at FDIC 2015, the industry's largest fire department instructor and training-based conference, in Indianapolis, IN. "FDIC proved to be a great opportunity to gather firefighter feedback." Bird went on to say, "We received an overwhelming response to the PRV as well as the enclosed slide out and down pump panel and the benefits it brings to every call."

Those interested in learning more about the Toyne PRV can view photos and download literature by visiting their official website at [www.Toyne.com](http://www.Toyne.com).
