## Fishing fleets dump nearly 10 million tonnes of fish back into oceans every year: Study

The research found that almost 10 per cent of the world's total catch in the last decade was discarded due to poor fishing practices and inadequate management.

Toronto: A new study has found that industrial fishing fleets dump nearly 10 million tonnes of good fish back into the world's oceans every year.

The research said almost 10 per cent of the world's total catch in the last decade was discarded due to poor fishing practices and inadequate management.

The study was conducted by researchers with Sea Around Us, an initiative at the University of British Columbia's Institute for the Oceans and Fisheries and the University of Western Australia.

This is equivalent to throwing back enough fish to fill about 4,500 Olympic sized swimming pools every year.

"In the current era of increasing food insecurity and human nutritional health concerns, these findings are important," said lead author for the study Dirk

Zeller, Professor at the University of Western Australia and senior research partner with the Sea Around Us.

Zeller said, "The discarded fish could have been put to better use."

The study examined the amount of discarded fish over time. In the 1950s, about five million tonnes of fish were discarded every year, in the 1980s that figure grew to 18 million tonnes.

It decreased to the current levels of nearly 10 million tonnes per year over the past decade, according to the findings published in the journal *Fish and Fisheries*.

The decline in discards in recent years could be attributed to improved fisheries management and new technology, but Zeller and his colleagues said it is likely also an indicator of depleted fish stocks.

As the Sea Around Us' 2016 global catch reconstruction paper revealed, catches have been declining at a rate of 1.2 million tonnes of fish every year since the mid-1990s.

He said, "Discards are now declining because we have already fished these species down so much that fishing operations are catching less and less each year, and therefore there's less for them to throw away."

Fishers also discard a portion of their catch because fishing practices damage the fish and make them unmarketable, the fish are too small, the species is out of season, only part of the fish needs to be harvested or the fishers caught species that they were not targeting, something known as bycatch.

Zeller said, "Discards also happen because of a nasty practice known as high-grading where fishers continue fishing even after they've caught fish that they can sell."

He added, "If they catch bigger fish, they throw away the smaller ones; they usually can't keep both loads because they run out of freezer space or go over their quota."
