Executive Summary

The Open Measurement Software Development Kit (OM SDK) is designed to facilitate third party viewability and verification measurement for ads served to mobile app environments without requiring multiple Ad Verification Service Providers (Measurement Provider) Software Development Kits (SDKs).

The OM SDK consists of a native library for iOS & Android operating systems (OS) as well as a JavaScript API, named Open Measurement Interface Definition (OMID). This document covers the details of the OMID API.

OMID is an API that enables standard communication of OM SDK data to measurement tags from Measurement Providers used to access information about the state of an advertisement and the environment it’s being served into.

App developers or their Advertising Software Development Kit (Ad SDK) providers must integrate the OM SDK and implement the OM SDK Javascript provided with the OM SDK to ensure that this communication may occur.

OM SDK is developed and managed by the Open Measurement Working Group (OMWG). More information about OMWG is available here: https://iabtechlab.com/working-groups/open-measurement-working-group/

Audience

This API document is designed for Ad SDK developers, App publishers and Measurement Providers to understand the API details.

More information on OM SDK available at: https://www.iabtechlab.com/OM SDK
About IAB Tech Lab

The IAB Technology Laboratory is an independent, international, research and development consortium charged with producing and helping companies implement global industry technical standards. Comprised of digital publishers and ad technology firms, as well as marketers, agencies, and other companies with interests in the interactive marketing arena, the IAB Tech Lab’s goal is to reduce friction associated with the digital advertising and marketing supply chain, while contributing to the safe and secure growth of the industry.

Introduction

The following documents the new OMID API, which is implemented in the OM SDK. The term “integration partner” has been used throughout this document to cater for both Ad SDK and publisher that implement direct OM SDK integrations.

OM SDK components

The diagram below shows the various Open Measurement SDK components and where each component has been designed to be integrated;

OM SDK supports two ad session types; HTML and native. When creating an HTML ad session OM SDK expects all JS components to be executed within the web view, but for native ad sessions OM SDK will create a JS execution environment enabling verification provider script execution.

Ad session

Central to the OMID API is the ad session which enables the integration partner to manage its lifecycle. This API has been designed to support a number of integration scenarios - these include;

1. HTML display ad sessions where the integration partner manages the lifecycle from the native SDK. This requires that the native SDK will be responsible for starting/finishing the ad session as well as recording the impression event.
2. HTML display ad sessions where the integration partner uses a combination of native SDK and JS SDK to manage the lifecycle. This still requires that the native SDK will be
responsible for starting/finishing the ad session but the JS SDK would contribute the ad session by triggering the ad impression event.

3. Native display ad sessions where the integration partner manages the lifecycle from the native SDK. Because this ad session type does not rely on web views for rendering OM SDK creates a JavaScript execution environment for communicating events to all verification providers.

4. HTML video ad sessions where the integration partner uses a combination of native SDK and JS SDK to manage the lifecycle which is very similar to the display scenario mentioned above. Because the HTML video ad session is designed to run with a HTML5 video player this scenario expects the JS SDK to interact with the JS video event API for communicating playback state.

5. Native video ad sessions where the integration partner manages the lifecycle from the native SDK which is very similar to the display scenario mentioned above. This video scenario also requires the native SDK to use the video event API for communicating playback state.

All ad session scenarios mentioned above support two registration API methods; one for ad view registration which enables the native SDK to notify OMID which view should be considered for viewability and another API for friendly obstructions which OMID will exclude from all viewability calculations.

For any integration partners wishing to use the OMID JS ad session API, this has been designed to be shared as source. Each JavaScript ad SDK will include OMID JS ad session client code within their existing script and minified using their existing processes.

OM SDK JS data service

Because OM SDK is designed to support both native only and native + JS ad sessions we have introduced a central OM SDK JS data service which collects all events from both ad session providers and is then responsible for notifying all registered OMID JS clients of any ad session / state changes.

The OM SDK JS data service also provides a detection mechanism which the OMID JS client will use so verification providers can apply the correct measurement strategy.

For HTML ad sessions it is important that integration partners ensure OMID JS data service has been injected prior to starting any ad session and loading verification provider scripts. For native ad sessions we require the integration partner to provide the downloaded OMID JS service content when creating any new ad session context.

OMID JS verification client

The OMID JS verification client is a utility that interfaces directly with the OMID JS data service both for detection and subscribing to ad session events. This verification client will also handle communication for both friendly and unfriendly placements (i.e. cross-domain iFrames). We recommend that all clients use this API when interested in OMID events.
We have designed the OMID JS verification client to be shared as source and for each verification provider to include this within their existing script and minified using their existing processes.

Video events
Because of the number of video player implementations available across the advertising ecosystem as well as challenges where JS video players may not have direct access to the top level window (i.e. cross-domain iFrames) we have introduced support for video event implementations in OM SDK. Each video player can select the most appropriate video event implementation and this will assume responsibility for publishing video events to the OM SDK JS data service.

Once the event has been received by the OM SDK JS data service these will then be shared with all registered OMID JS clients - see above section for more details. See the below sequence diagram for more information;

For any integration partners wishing to use the OMID JS video events API this has been designed to be shared as source and for each HTML5 video player to include this within their existing script and minified using their existing processes.

https://www.iabtechlab.com/omsdk
OM SDK namespace builds

The OM SDK build process supports both namespace and generic OM SDK library builds. The generic builds use the class and package names described in this document. Namespaced builds rename the classes and package names to allow ad SDK integrators to include OM SDK in their SDKs without conflicting with other Ad SDKs. Ad SDKs and Apps must use the namespaced version of OM SDK.

OM SDK JS service injection strategies

For HTML ad sessions each integration partner is responsible for ensuring that the OM SDK JS service has been injected into the webview prior to any additional JS components.

For native ad sessions each integration partner is expected to download and provide the OM SDK JS service content when creating new ad session contexts. Any attempt to create an ad session without a valid OM SDK JS service will result in an error.

Below we have detailed some possible solutions to OM SDK JS service injection for HTML ad sessions.

Server-side OM SDK JS service script content injection

This injection strategy relies on the ad server being responsible for downloading the OM SDK JS service script content and modifying the original HTML ad response.

The following outlines the steps required to support this injection strategy;

1. Ad server requests and caches the OM SDK JS service script content.
2. Integration partner creates new OMID ad session.
3. OMID enabled ad request is received by the ad server.
4. Ad server modifies the HTML ad response to prepend OM SDK JS service script content - for example: <script>downloaded/cached OM SDK JS service script content</script> Original tag HTML content>.
5. Integration partner receives HTML ad response and injects content into the registered web view.
6. Integration partner notifies OM SDK that the ad session can be started.

This solution assumes that the ad server will take responsibility for ensuring that OM SDK JS service script content is correctly injected into the HTML ad response across the variety of supported tags.

*Please note that this is the recommended OM SDK JS service injection solution as this provides the most flexibility when it comes to updating any injection rules without impacting the client integration.*

https://www.iabtechlab.com/omsdk
Client-side OM SDK JS service script content injection

This injection strategy relies on the integration partner assuming responsibility for downloading and caching the OM SDK JS service from their CDN. Once available the integration can choose between using the OMID script injection API or implement their own injection strategy using the downloaded script content.

The following outlines the steps required to support this injection strategy;

1. Integration partner SDK will download / cache their AVID JS service resource.
2. Integration partner creates new OMID ad session.
3. OMID enabled ad request is received by the ad server and unmodified ad response sent back to integration partner.
4. If OM SDK JS service download is complete then use the OMID script injection API to modify HTML ad content. If OM SDK JS service download is not yet complete then wait for download callback.
5. Integration partner injects the modified content into the registered web view.
6. Integration partner notifies OMID that the ad session can be started.

When it comes to using the OMID script injection API the following rules will apply;

- If the HTML ad response contains no `<html>`, `<head>` or `<body>` then the script content will be prepend to the HTML.
- If the HTML ad response contains a `<html>` element with no `<head>`, but a `<body>` element then the script content will be added as the first child element of the `<body>`.
- If the HTML ad response contains a `<html>` element with both a `<head>` and `<body>` elements then the script content will be added as the first child element of the `<head>`.
- If the HTML ad response contains a `<html>` element with no `<head>` or `<body>` elements then the script content will be added as the first child element of the `<html>`.
- If the HTML ad response contains a `<!DOCTYPE html>` element with no `<html>`, `<head>` or `<body>` elements then the script content will be added as the first child element of the `<!DOCTYPE html>`.

This implementation will also cater for situations where any element has been commented out - for example, `<html> <!-- <head></head> --> <body></body></html>`. In this example the script content will be added as the first child element of the `<body>`.

The OMID script injector will also be able to handle self-closing tags - for example; `<html><head/> <body>... </body></html>` will be converted into `<html><head>script</head><body>... </body></html>`.

https://www.iabtechlab.com/omsdk
Ad session lifecycle

As highlighted above the OMID API is designed to support a variety of integration styles. The diagrams below cover these off in more detail explain how the OMID API should be used in each scenario.

Note that creating an OMID ad session in the native layer sends a message to the OM SDK JS Service running in the webview. If the OM SDK JS Service has not loaded before the ad session is created, the message is lost, and the verification scripts will not receive any events. To prevent this, the implementation must wait until the webview finishes loading OM SDK JS before starting the OMID ad session.

Also note that ending an OMID ad session sends a message to the verification scripts running inside the webview supplied by the integration. So that the verification scripts have enough time to handle the “sessionFinish” event, the integration must maintain a strong reference to the webview for at least 1.0 seconds after ending the session.

In Android, for all ad sessions that are created, finish must be called once the ad session is no longer required, otherwise memory will be leaked.

In iOS, for all ad sessions that are started, finish must be called once the ad session is no longer required, otherwise memory will be leaked.

Display ad session with no contributing JS ad session

The below diagram demonstrates the OMID display ad session lifecycle where the integration partner wishes to only use the full native OMID API.

https://www.iabtechlab.com/omsdk
Display ad session with a contributing JS ad session

The below diagram demonstrates the OMID display ad session lifecycle where the integration partner wishes to use both the native and JS OMID API.
OMID API

Video ad session with native video player

The below diagram demonstrates the OMID video ad session lifecycle using a native video player.

https://www.iabtechlab.com/omsdk
Video ad session with HTML video player

The below diagram demonstrates the OMID video ad session lifecycle using a HTML video player.
As detailed in the OMID API, when creating the native ad session you will need to provide partner information and ad session context.

This diagram assumes that the integration partner is handling OMID JS service injection. As described in the OMID API, JS injection can be handled in a variety of ways but it is important that the OMID JS service has been loaded prior to starting the ad session.

Similar to the native ad session API, both partner information and ad session context is required when creating a JS ad session instance.

Video player registration is achieved by using the VideoEyes API, which requires reference to the ad session instance.

In order to record an impression event the integration partner is required to use the JS AdEvents API.

This uses the VideoEvents instance registered with the video player.
Supporting verification script resources in VAST

Unlike HTML ad formats where all verification clients will be loaded using the more traditional `<script src="..."></script>` HTML element for video ad formats we will be using VAST XML ad responses as detailed below;

VAST version 4.1 support via ad verifications node

Below is an example of how to include verification information VAST 4.1 tags. Please refer to VAST 4.1 specification for exact usage of different parameters in `<AdVerifications>` node.

<table>
<thead>
<tr>
<th>VAST version 4.1 OMID example</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;AdVerifications&gt;</code></td>
</tr>
<tr>
<td><code>&lt;Verification vendor=&quot;company.com-omid&quot;&gt;</code></td>
</tr>
<tr>
<td><code>&lt;JavaScriptResource apiFramework=&quot;omid&quot; browserOptional=&quot;true&quot;&gt;</code></td>
</tr>
<tr>
<td><code>&lt;![CDATA[https://verification.com/omid_verification.js]]&gt;</code></td>
</tr>
<tr>
<td><code>&lt;/JavaScriptResource&gt;</code></td>
</tr>
<tr>
<td><code>&lt;TrackingEvents&gt;</code></td>
</tr>
<tr>
<td><code>&lt;Tracking event=&quot;verificationNotExecuted&quot;&gt;</code></td>
</tr>
<tr>
<td><code>&lt;![CDATA[https://verification.com/trackingurl/[REASON]]]&gt;</code></td>
</tr>
<tr>
<td><code>&lt;/Tracking&gt;</code></td>
</tr>
<tr>

<tr>
<td><code>&lt;/VerificationParameters&gt;</code></td>
</tr>
<tr>
<td><code>&lt;/Verification&gt;</code></td>
</tr>
<tr>
<td><code>&lt;/AdVerifications&gt;</code></td>
</tr>
</tbody>
</table>

Pre-VAST version 4.1 support via a custom extension

For older versions of VAST documents namely VAST 2.0, VAST 3.0 or VAST 4.0, verification code should be loaded via Extensions node specifying ‘Extension type’ as ‘AdVerifications’. The root element is ‘AdVerifications’ node with the same schema as the VAST 4.1 ‘AdVerifications’ node.

<table>
<thead>
<tr>
<th>Pre-VAST version 4.1 OMID example</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;Extensions&gt;</code></td>

  <Tracking event="verificationNotExecuted"> <![CDATA[https://verification.com/trackingurl]]> 
  </Tracking>
</TrackingEvents>
<VerificationParameters> <![CDATA[verification params key value pairs]]> 
</VerificationParameters>
</Verification>
</AdVerifications>
</Extension>
</Extensions>
Android OMID library API

Usage

Check for OMID compatibility and library activation

1. Verify that Omid class exists *(this is important only when the integration partner is using a shared OMID library).*
2. Execute Omid.isCompatibleWithOmidApiVersion and ensure that true is returned.
   a. if false is returned you must avoid using the integrated OMID library as this will produce errors.
3. Check if OMID has already been activated by calling Omid.isActive.
   a. if OMID has not been activated then you will need to execute Omid.activateWithOmidApiVersion.

Load and inject OM SDK JS script content into tag response *(optional)*

1. Each integration partner is responsible for downloading and caching the OM SDK JS service ready for use in the OMID ad session.
2. Once the OM SDK script content has been downloaded then OMID JS injection can be performed calling ScriptInjector.injectScriptContentIntoHtml.

Using the OMID ad session API

1. Create a new Partner object.
2. Create a new Context object specifying the Partner and either a web view instance or a list of verification script resources.
3. Create a new AdSession object specifying the Context.
4. Once ready start the ad session executing AdSession.start.
5. Once started you can now record ad session events - see ad events and video events detailed below.
6. All ad session errors should be recorded calling AdSession.error.
7. Once the ad session has finished execute AdSession.finish.

Handling ad session ad events (display and video)

1. Create AdEvents object specifying the AdSession instance.
2. Notify the ad session when an impression has occurred by calling AdEvents.impressionOccured. This step can be ignored if the JS ad session controls when the impression event should be triggered.

Handling ad session video events (video only)
For HTML video ad sessions this will be handled by the JS ad session.
OMID API

1. Create VideoEvents object specifying the AdSession instance.
2. Update video player implementation to trigger the appropriate video events during content loading / playback.

Thread Safety
OMID library functions must be called only from the main UI thread of the application. This is the same rule that the Android and iOS UI frameworks require.

API

com.iab.omid.library.Omid

```java
package com.iab.omid.library;

/**
 * This application level class will be called by all integration partners to ensure OMID has
 * been activated before calling any other API methods. Any attempt to use other API methods prior to activation will result in an exception.
 */

public final class Omid {

    /**
     * Access the running OMID library semantic version.
     *
     * @return the current semantic version of the integrated OMID library.
     */
    public static String getVersion();

    /**
     * Used to determine if the running OMID library is active before attempting to create
     * any ad sessions.
     */
    public static boolean isCompatibleWithOmidApiVersion(final String version);
public static boolean isActive();

/**
 * Enables the integration partner to activate OMID prior to calling any other API methods.
 * @param version of OMID library integrated by the partner.
 * @param applicationContext of the running application.
 * @return true if activation was successful when checking the supplied version number for compatibility.
 * @throws IllegalArgumentException if the supplied version parameter is null, blank or an invalid semantic version number.
 * @throws IllegalArgumentException if the supplied application context is null.
 */
public static boolean activateWithOmidApiVersion(String version, Context applicationContext);

com.iab.omid.library.ScriptInjector
package com.iab.omid.library;

/**
 * Utility class which enables integration partners to use a standard approach for injecting OMID JS into the served tag HTML content.
 * <p>
 */
public final class ScriptInjector {

/**
 * Injects the supplied OMID JS content into the served HTML.
 * @param scriptContent containing the OMID JS service content to be injected into the hidden tracking web view.
 * @param html of the tag content which should be modified to include the downloaded OMID JS content.
 * @return modified HTML to include the supplied OMID JS service.
 * @throws IllegalArgumentExpection if the supplied HTML is either null or blank.
 * @throws IllegalStateException if this method has been executed before OMID has been activated.
 * @throws IllegalStateException if this method has been executed before OMID JS is available.
 */
public static String injectScriptContentIntoHtml(String scriptContent, String html);
```java
package com.iab.omid.library.adsession;

public class Partner {

    /**
     * Create new partner instance providing both name and version.
     * Both name and version are mandatory.
     *
     * @param name used to uniquely identify the integration partner.
     * @param version used to uniquely identify the integration partner.
     * @return a new partner instance
     * @throws IllegalArgumentException if any of the parameters are either null or blank.
     */
    public static Partner createPartner(final String name, final String version);
}

package com.iab.omid.library.adsession;

public final class AdSessionContext {

    /**
     * Create a new "html" ad session context.
     *
     * @param partner details of the integration partner responsible for the ad session
     * @param webView responsible for serving the ad content
     * @param customReferenceData containing reference data specific to the integration partner.
     * @return a new HTML context instance
     * @throws IllegalArgumentException if the supplied partner is null.
     * @throwsIllegalArgumentException if the supplied webView is null.
     * @throws IllegalArgumentException if customReferenceData is greater than 256 characters.
     * @see Partner
     * @see WebView
     */
    public static AdSessionContext createHtmlAdSessionContext(final Partner partner,
                                                               final WebView webView,
                                                               final String customReferenceData);
```

https://www.iabtechlab.com/omsdk
/**
 * Create a new "native" ad session context.
 *
 * @param partner details of the integration partner responsible for the ad
 * @param omidJsScriptContent containing the OMID JS service content to be injected into
 * @param verificationScriptResources of all verification providers who expect to receive OMID
 * @param customReferenceData containing reference data specific to the integration
 * @return a new native context instance
 * @throws IllegalArgumentException if the supplied partner is null.
 * @throws IllegalArgumentException if the supplied omidJsScriptContent is null or blank.
 * @throws IllegalArgumentException if the supplied verificationScriptResources is null or empty.
 * @throws IllegalArgumentException if customReferenceData is greater than 256 characters.
 * @see Partner
 * @see VerificationScriptResource
 */

public static AdSessionContext createNativeAdSessionContext(final Partner partner, final String omidJsScriptContent, final List<VerificationScriptResource> verificationScriptResources, final String customReferenceData);

com.iab.omid.library.adsession.VerificationScriptResource

package com.iab.omid.library.adsession;

/**
 * Details about the verification provider which will be supplied to the ad session.
 */

public final class VerificationScriptResource {

/**
 * Create new verification script resource instance which requires vendor specific verification parameters.
 * When calling this method all arguments are mandatory.
 *
 * @param vendorKey used to uniquely identify the verification provider.
 * @param resourceUrl to be injected into the OMID managed JavaScript execution
 */
public static VerificationScriptResource createVerificationScriptResourceWithParameters(final String vendorKey, final URL resourceUrl, final String verificationParameters);

/**
 * Create new verification script resource instance which does not require any vendor specific
 * verification parameters.
 * When calling this method all arguments are mandatory.
 *
 * @param resourceUrl to be injected into the OMID managed JavaScript execution environment.
 * @return a new verification script resource instance
 * @throws IllegalArgumentException if any of the parameters are either null or blank.
 */
public static VerificationScriptResource createVerificationScriptResourceWithoutParameters(final URL resourceUrl);

com.iab.omid.library.adsession.AdSessionConfiguration
package com.iab.omid.library.adsession;

public class AdSessionConfiguration {

/**
 * Create new ad session configuration supplying the owner for both the impression and video
 * events.
 * The OMID JS service will use this information to help identify where the source of these
 * events is expected to be received.
 *
 * @param impressionOwner of whether the native or JavaScript layer should be responsible for
 * supplying the impression event.
 * @param videoEventsOwner of whether the native or JavaScript layer should be responsible for
 * supplying video events. This is only required for video ad sessions.
 * @param isolateVerificationScripts When true, verification scripts are in a sandboxed iframe.
 * When false, verification scripts have access to DOM of webview.
 * This setting is only applicable when verification script resources are
 * injected via the javascript session client (typically this would only
 * be relevant for HTML video ad sessions)
 * @return new ad session configuration instance.
 * @throws IllegalArgumentException if the supplied impressionOwner is null.
 */
public static AdSessionConfiguration createAdSessionConfiguration(final Owner impressionOwner,
final Owner videoEventsOwner,
final boolean isolateVerificationScripts);
com.iab.omid.library.adsession.ErrorType

```java
package com.iab.omid.library.adsession;

/**
 * List of supported error types.
 * <ul>
 * <li>GENERIC will translate to "generic" string when published to the OMID JS service.</li>

com.iab.omid.library.adsession.AdSession

```java
package com.iab.omid.library.adsession;

/**
 * Ad session API enabling the integration partner to notify OMID of key state relating to
 * viewability calculations.
 * In addition to viewability this API will also notify all verification providers of key
 * ad session
 * lifecycle events.
 */
public abstract class AdSession {

    /**
     * Create new ad session supplying the adSessionConfiguration and adSessionContext.
     * Note that creating an AdSession sends a message to the OM SDK JS Service running in
     * the
     * message is lost, and the verification scripts will not receive any events.
     * To prevent this, the implementation must wait until the webview finishes loading OM
     * JavaScript before creating the AdSession. The easiest way is to create the AdSession
     * in a
     * webview callback WebViewClient.onPageFinished(). Alternatively, if an implementation
     * can
     * receive an HTML5 DOMContentLoaded event from the webview, it can create the
     * OMIDAdSession in
     * a message handler for that event.
     * @param adSessionContext that provides the required information for initialising the
     * ad session.
     * @return new AdSession instance
     */
```
* @throws IllegalArgumentException if the supplied adSessionContext is null.
* @throws IllegalStateException if this method has been executed before OMID has been activated.
*/

iOS OMID Library API

Usage

Set up OMID:
1. Verify that OMIDSDK class exists.
2. Verify that OMIDSDK responds to isCompatibleWithOMIDAPIVersion:
3. Call +[OMIDSDK isCompatibleWithOMIDAPIVersion:]
4. If returns NO, don't call anything else.
5. Activate OMID. Call -[OMIDSDK activateWithOMIDAPIVersion:error:]

After creating ad:
1. Create an OMIDPartner object.
2. If using OMID-managed verification JS, create an OMIDVerificationResource for each verification URL/file.
3. Create an OMIDAdSessionContext object with web view or verification script resources.
4. Create an OMIDAdSession object.
5. Create OMID*Events object(s).

On ad events:
1. Create OMID*Events objects if required.
2. Call OMID*Events methods.

API

OMID JS ad session client API

The API detailed below should be used where the integration partner relies on JS components when contributing to the ad session state. This API can be used in the following scenarios:

1. Video ad session relying on the HTML5 video player for injecting verification script resources and/or publishing OMID video events.
2. Display ad session relying on a separate JS component to handle the impression event.

Partner

Constructor Summary

Partner(name, version);

Method Summary

No public methods available.

VerificationScriptResource

This object is intended to be used by JavaScript integration partners responsible for parsing the VAST ad response. When the video player discovers `<Verification>` nodes these should be registered with the OMID JS data service via this API.

Constructor Summary

VerificationScriptResource(String resourceUrl, String vendorKey, String verificationParameters)

*NOTE: the vendorKey is only mandatory when verification parameters have been provided.*

Method Summary

No public methods available.

Context

Constructor Summary

Context(partner, verificationScriptResources);
**OMID API**

**partner** is mandatory for all Context instances

**verificationScriptResources** is optional but when supplied must contain a list of resources intended to be handled by OMID JS.

**Method Summary**

<table>
<thead>
<tr>
<th>Modifier and type</th>
<th>Method and description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td>setVideoElement(videoElement)</td>
</tr>
<tr>
<td></td>
<td>videoElement: HTMLVideoElement DOM object.</td>
</tr>
<tr>
<td></td>
<td>Specifies the video player element in the webview. Causes OM SDK JS Service to include DOM geometry in geometryEvents and media playback state in video events.</td>
</tr>
<tr>
<td></td>
<td>If the video player is in a cross domain iframe, it won't be accessible to the OM SDK JS Service. The ad session client should use setSlotElement().</td>
</tr>
<tr>
<td>void</td>
<td>setSlotElement(slotElement)</td>
</tr>
<tr>
<td></td>
<td>slotElement: DOM object with ad creative.</td>
</tr>
<tr>
<td></td>
<td>Specifies the ad creative element in the webview. Causes OM SDK JS Service to include DOM geometry in geometryEvents.</td>
</tr>
<tr>
<td></td>
<td>If the ad creative is in a cross-domain iframe, it won't be accessible to the OM SDK JS Service. The ad session client should pass the iframe element to this method, and should also call Session.setElementBounds() if the ad creative does not fill the iframe.</td>
</tr>
</tbody>
</table>

**OmidVersion**

**Constructor Summary**

Omid(String semanticVersion, String apiLevel);

**Method Summary**

No public methods available.

**AdSession**

Similar to the OMID JS verification client this provides a JavaScript representation of the ad session enabling JS components to contribute to the overall state and publish events. The OMID JS ad session is responsible for communicating to the OMID JS data service and will
also handle scenarios with limited access to the OMID JS data service - i.e. cross-domain iFrames.

Constructor Summary

OMID JS verification client API

The OMID JS verification client should be integrated into all JavaScript resources which require access to the OMID JS events - i.e. verification providers. This will automatically handle situations where the OMID JS verification client exists at the top level window and also when situated inside a cross-domain iFrame (using postMessage and the OMID detection iFrame).

The standard process for working with the OMID JS client includes;
1. Copy the OMID JS client source code into your project
2. Create new OMID JS client instance
3. Interface with OMID JS client in order to access OMID state
4. Ensure OMID JS client has been included as part of any minification process

NOTE: the OMID JS client source code is available and has been designed to be minified as part of the JavaScript build process.

VerificationClient

Constructor Summary
VerificationClient();

Method Summary

<table>
<thead>
<tr>
<th>Modifier and type</th>
<th>Method and description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>isSupported()</td>
</tr>
<tr>
<td>void</td>
<td>registerSessionObserver(functionToExecute, vendorKey)</td>
</tr>
</tbody>
</table>
|                   | Allows verification providers to observe the ad session lifecycle. This will also supply each registered verification provider with details of the ad session context as well as verification parameters for the the specified vendorKey. The vendorKey is optional and if not specified then no verification parameters lookup will be performed. Each session observer will be notified of the following two events; sessionStart, sessionError, sessionFinish
Details of each event type have been detailed here. functionToExecute(event) - function to execute when the event has been triggered. All listeners will be required to support a single event parameter - see table below for data structure. |
| void              | addEventListener(eventType, functionToExecute) |
|                   | Supported eventType values include; |
### OMID API

- **impression**
- **geometryChange**
- **video**

Details of each event type have been detailed [here](https://www.iabtechlab.com/omsdk).

- `functionToExecute(event)` - function to execute when the event has been triggered. All listeners will be required to support a single event parameter - see table below for data structure.

---

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
</table>
| `void sendUrl(url, successCallback, failureCallback)` | This function will transmit data to the target URL handling both HTML and native ad sessions selecting the most appropriate method for remote communication. Both the `successCallback` and `failureCallback` arguments are optional, but if supplied the callback function will be executed at the appropriate times. 
For all DOM based environments (incl. Android native ad sessions) we will use images to send URLs. For native ad sessions we will delegate responsibility to the OMID library. |
| `int setTimeout(functionToExecute, timeInMillis)` | This function will provide timeout support for both HTML and native ad sessions. Calling this method will respond with a unique timeout id which can later be used to clear the timeout if required. 
For all DOM based environments (incl. Android native ad sessions) we will use the standard window.setTimeout API. For native ad sessions we will delegate responsibility to the OMID library. |
| `void clearInterval(timeoutId)` | This function will provide support for clearing any activate timeout ids. 
For all DOM based environments (incl. Android native ad sessions) we will use the standard window.clearTimeout API. For native ad sessions we will delegate responsibility to the OMID library. |
| `int setInterval(functionToExecute, timeInMillis)` | This function will provide interval support for both HTML and native ad sessions. Calling this method will respond with a unique interval id which can later be used to clear the interval if required. 
For all DOM based environments (incl. Android native ad sessions) we will use the standard window.setInterval API. For native ad sessions we will delegate responsibility to the OMID library. |
| `void clearInterval(intervalId)` | This function will provide support for clearing any activate interval ids. 
For all DOM based environments (incl. Android native ad sessions) we will use the standard window.clearInterval API. For native ad sessions we will delegate responsibility to the OMID library. |
OMID API

void injectJavaScriptResource(url, successCallback, failureCallback)

This function will provide support for injecting the supplied JavaScript resource into the same execution environment as the verification provider. Both the successCallback and failureCallback arguments are optional, but if supplied the callback function will be executed at the appropriate times.

For all DOM based environments (incl. Android native ad sessions) we will append <script> elements to the DOM. For native ad sessions we will delegate responsibility to the OMID library which will be responsible for downloading and injecting the JavaScript content into the execution environment.

OMID JS event types

All OMID JS events will include the following mandatory information;

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>adSessionId</td>
<td>String</td>
<td>Unique ad session id - i.e. ABC-123.</td>
</tr>
<tr>
<td>timestamp</td>
<td>Integer</td>
<td>Received message time in milliseconds.</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>Possible values common across all ad sessions include;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● sessionStart</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● sessionError</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● impression</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● geometryChange</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● sessionFinish</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For all “video” event listeners the following event types may be</td>
</tr>
<tr>
<td></td>
<td></td>
<td>triggered;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● loaded</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● start</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● firstQuartile</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● midpoint</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● thirdQuartile</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● complete</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● pause</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● resume</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● bufferStart</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● bufferFinish</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● skipped</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● volumeChange</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● playerStateChange</td>
</tr>
<tr>
<td></td>
<td></td>
<td>● adUserInteraction</td>
</tr>
<tr>
<td>data</td>
<td>Object</td>
<td>The data structure for each event type has been detail below.</td>
</tr>
</tbody>
</table>
### sessionStart event data

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>context</td>
<td>Object</td>
<td>Yes</td>
<td>Provides key information about the current ad session. The table below provides more detail on the Context object.</td>
</tr>
<tr>
<td>verificationParameters</td>
<td>String</td>
<td>No</td>
<td>A list of verification parameters matching the supplied vendor key.</td>
</tr>
</tbody>
</table>

**NOTE:** this is important to verification vendors who rely on external data for their JavaScript client to initialise. This is primarily required when the verification client JavaScript is being rendered outside of any HTML ad response - i.e. VAST or native display ad format.

#### Context object

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>environment</td>
<td>String</td>
<td>Yes</td>
<td>For mobile app this will be hardcoded to “app”.</td>
</tr>
<tr>
<td>adSessionType</td>
<td>String</td>
<td>Yes</td>
<td>Possible values include; “native” or “html”</td>
</tr>
</tbody>
</table>
| supports           | Array    | Yes       | List of available features for the ad session - possible values include;  
|                    |          |           | ● “clid” which indicates that the OMID ad session supports the container lifecycle interface.                                                |
|                    |          |           | ● “vlid” which indicates that the OMID ad session supports the video lifecycle interface.                                                     |
|omidNativeInfo      | Object   | Yes       | This will include both the integration partner name and version - for example;                                                             |
|                    |          |           | omidNativeInfo: {  
|                    |          |           |   partnerName: ‘examplePartner’,  
|                    |          |           |   partnerVersion: ‘1.0.0’  
|                    |          |           |  }                                                                                                                                         |
|                    |          |           | Both partnerName and partnerVersion are mandatory.                                                                                           |
|omidJsInfo          | Object   | Yes       | This will include additional version information taken from the JavaScript layer - for example;                                           |
|                    |          |           | omidJsInfo: {  

[https://www.iabtechlab.com/omsdk](https://www.iabtechlab.com/omsdk)
The `serviceVersion` is mandatory, but `sessionClientVersion` will only be supplied if the JS SDK is contributing to the ad session.

The `partnerName` and `partnerVersion` will only be supplied if the JS SDK is contributing to the ad session.

```
deviceInfo: {
    deviceType: "iPhone7,2",
    osVersion: "11.1.2",
    os: "iOS|Android"
}
```

deviceInfo is an object and is only supplied if the JS SDK is contributing to the ad session.

```
app: {
    libraryVersion: '1.0.0'
    appId: 'com.example.app'
}
```

`app` is an object and is only supplied if the JS SDK is contributing to the ad session.

`customReferenceData` is a string and is not required.

```
customReferenceData: "key data"
```

Provides key reference data related to the ad session. There is no formal structure to the reference data, but it enables publishers to share key data with verification providers.

### sessionError event data

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Required?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorType</td>
<td>String</td>
<td>Yes</td>
<td>Possible values include; GENERIC and VIDEO.</td>
</tr>
<tr>
<td>message</td>
<td>String</td>
<td>Yes</td>
<td>Description about the ad session error.</td>
</tr>
</tbody>
</table>

### sessionFinish event data

No event data supplied with this event.
impression event data

</tbody>
</table>
geometry data as detailed below;
{
  x: 0,
  y: 0,
  width: 320,
  height: 50
}

The onScreenGeometry can be missing if the registered ad view has not been detected in the app view hierarchy.

Provides geometry data of the ad view after processing all parent views to check whether the ad view has been clipped. If the ad session script called Context.setVideoElement() or Context.setSlotElement(), or find the marked up element, then this field considers the DOM geometry and Session.setElementBounds() rectangle along with the native-layer geometry.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>containerGeometry</td>
<td>Object</td>
<td>Yes</td>
<td>Provides geometry data of the ad container (webview) for the current ad session id. If the ad session script did not call Context.setVideoElement() or Context.setSlotElement(), or find the marked up element, then this field is identical to the geometry field.</td>
</tr>
<tr>
<td>onScreenContainerGeometry</td>
<td>Object</td>
<td>Yes</td>
<td>Provides geometry data of the ad container (webview) for the current ad session id that is currently visible/on screen. If the ad session script did not call Context.setVideoElement() or Context.setSlotElement(), or find the marked up element, then this field is identical to the onScreenGeometry field.</td>
</tr>
<tr>
<td>measuringElement</td>
<td>Boolean</td>
<td>Yes</td>
<td>A boolean field that will be true if the geometry change data takes creative measurement into account. If the ad session script did not call Context.setVideoElement() or Context.setSlotElement(), or find the marked up element, then this field will be set to false.</td>
</tr>
<tr>
<td>reasons</td>
<td>Array</td>
<td>Yes</td>
<td>The table below provides further information into the possible values;</td>
</tr>
<tr>
<td>Reason</td>
<td>Description</td>
<td></td>
<td></td>
</tr>
<tr>
<td>--------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
<td></td>
<td></td>
</tr>
<tr>
<td>notFound</td>
<td>this indicates that the registered ad view has not been found within the app view hierarchy.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>hidden</td>
<td>Not used at this time.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>backgrounded</td>
<td>this indicates that the application has been backgrounded. Not fully supported on Android at this time.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>obstructed</td>
<td>this indicates that the registered ad view is being obstructed by another view (excluding all registered friendly obstructions).</td>
<td></td>
<td></td>
</tr>
<tr>
<td>clipped</td>
<td>this indicates that the registered ad view has been clipped by a smaller parent view (iOS only).</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In the majority of cases it is possible to have multiple reasons returned (for example, “obstructed” and “clipped”) however only a single reason will be provided for “notFound”, “hidden” and “backgrounded”.

If the ad view is fully in view then the list of reasons will be empty.

**video event data**

<table>
<thead>
<tr>
<th>Type</th>
<th>Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>loaded</td>
<td>`{ skippable: &lt;boolean&gt;,</td>
</tr>
<tr>
<td></td>
<td>skipOffset: &lt;float&gt;,</td>
</tr>
<tr>
<td></td>
<td>autoPlay: &lt;boolean&gt;,</td>
</tr>
<tr>
<td></td>
<td>position: &lt;string&gt;}`</td>
</tr>
</tbody>
</table>
Skippable, autoPlay and position are all mandatory fields with skipOffset only required if skippable is true.

Supported position values include:

<table>
<thead>
<tr>
<th>Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>preroll</td>
<td>The ad plays preceding video content.</td>
</tr>
<tr>
<td>midroll</td>
<td>The ad plays in the middle of video content, or between two separate content videos.</td>
</tr>
<tr>
<td>postroll</td>
<td>The ad plays following video content.</td>
</tr>
<tr>
<td>standalone</td>
<td>The ad plays independently of any video content.</td>
</tr>
</tbody>
</table>

```
start {
  duration: <float>,
  videoPlayerVolume: <float>,
  deviceVolume: <float|null>
}
```

The videoPlayerVolume range is between 0 and 1. The deviceVolume range is between 0 and 1, or null if not specified by the native layer.

firstQuartile
midpoint
thirdQuartile
complete

```
pause
```

Notifies all video listeners that video playback has paused (excluding pauses caused by buffering).

resume

```
bufferStart
```

Notifies all video listeners that video playback has stopped and started buffering.

bufferFinish
skipped

```
volumeChange {
  videoPlayerVolume: <float>,
  deviceVolume: <float|null>
}
```

The videoPlayerVolume range is between 0 and 1. The deviceVolume range is between 0 and 1, or null if not specified.
by the native layer.

<table>
<thead>
<tr>
<th>playerStateChange</th>
<th>{ state: &lt;string&gt; }</th>
</tr>
</thead>
<tbody>
<tr>
<td>Possible state values include:</td>
<td></td>
</tr>
<tr>
<td>● “minimized” - the player is collapsed in such a way that the video is hidden. The video may or may not still be progressing in this state, and sound may be audible. This refers specifically to the video player state on the page, and not the state of the browser window.</td>
<td></td>
</tr>
<tr>
<td>● “collapsed” - the player has been reduced from its original size. The video is still potentially visible.</td>
<td></td>
