## CLAY AND SHALE

---

# CLAY AND SHALE

By Robert L. Virta

Domestic survey data and tables were prepared by Robin C. Kaiser, statistical assistant, and the world production tables were prepared by Lisa D. Miller, international data coordinator.

The quantity of clay sold or used by domestic producers in 2011 decreased slightly to 25.3 million metric tons (Mt) valued at \$1.53 billion compared with 25.6 Mt valued at \$1.48 billion in 2010 (table 1). Common clay and shale accounted for 46% of the tonnage, and kaolin accounted for 54% of the value (tables 1, 5, and 8). In 2011, exports increased slightly to 4.39 Mt valued at \$908 million compared with 4.36 Mt valued at \$862 million in 2010. Imports of clays were 593,000 metric tons (t) valued at \$97.4 million in 2011 compared with 555,000 t valued at \$81.2 million in 2010 (table 1). World production of bentonite was 10.3 Mt, production of fuller's earth was 3.21 Mt, and production of kaolin was 33.9 Mt (tables 16–18).

Approximately 180 companies mined clay and shale in the United States in 2011. The 20 leading companies, many with multiple operations, accounted for 59% of the tonnage and 85% of the value for all types of clay sold or used. Clay production was reported in all States except Alaska, Delaware, Hawaii, Idaho, Minnesota, New Hampshire, New Jersey, Rhode Island, Vermont, and Wisconsin (table 2). Companies that mined clay for construction fill and landfill caps and did not operate mills or plants were not included in the U.S. Geological Survey (USGS) canvass of the clay and shale industry. These companies operated in most, if not all, States.

The 10 leading producer States were, in decreasing order of tonnage, Georgia, Wyoming, Texas, Alabama, Missouri, Virginia, North Carolina, Tennessee, Mississippi, and Ohio. The 15 leading producer companies were, in alphabetical order, American Colloid Co. (bentonite); BASF SE (bentonite, fuller's earth, and kaolin); Bentonite Performance Minerals LLC (bentonite); Black Hills Bentonite, LLC (bentonite); Carbo Ceramics Inc. (kaolin); Cemex USA (common clay and shale); General Shale, Inc. (common clay and shale); Imerys SA (ball clay and kaolin); KaMin LLC (kaolin); M-I L.L.C. (bentonite); Nestlé S.A. (fuller's earth); Oil-Dri Corp. of America (fuller's earth); Texas Industries, Inc. (common clay and shale); Thiele Kaolin Co. (kaolin); and Unimin Corp. (ball clay and kaolin).

Most clay mining in the United States was by open pit methods; less than 1% of U.S. clay output was from underground mines. Most underground production was in Ohio, where the clays were mainly underclays associated with coal.

Domestic production data for clays were developed by the USGS from a voluntary survey of U.S. operations. Responses to the survey and company production data available from other sources accounted for approximately 50% of the total clay and shale tonnage sold or used quantity listed in table 1. Production data for the nonrespondents were estimated from preliminary survey data or reported prior-year production levels adjusted by trends in the industry, employment hours, and other guidelines.

## Ball clay

**Production.**—In 2011, four companies mined ball clay in five States. Production of domestic ball clay decreased by 3% to 886,000 t valued at \$40.9 million compared with 912,000 t valued at \$41.3 million in 2010 (table 3). Operations in Tennessee supplied 63% of the production, followed by, in descending order of tonnage, Texas, Mississippi, and Kentucky. One producer reported a small quantity of production in Indiana, but this probably was fire clay rather than ball clay.

**Consumption.**—Consumption of ball clay decreased in 2011. The two principal domestic markets were, in decreasing order by tonnage, ceramic floor and wall tile (38%) and sanitaryware (20%). Ball clay also was sold to manufacture bricks, fiberglass, refractory products, and other types of ceramics. Ball clay also was sold for filler, extender, and binder applications (table 3). Sales for fiberglass and some filler and extender applications were likely to have been kaolin mined or purchased by the ball clay producers. Domestic sales to the larger markets declined 4% to 6% while exports increased 9%. Exports accounted for 23% of total ball clay sales.

Domestic sales of ball clay can be affected by imports of products such as ceramics and sanitaryware because they compete with ball clay-based ceramic products manufactured in the United States. The U.S. International Trade Commission (undated) reported that imports of ceramic tile under Harmonized Tariff Schedule (HTS) of the United States Codes 6907.10.00, 6908.10.10, 6908.10.20, and 6908.10.50 increased in quantity to 7.80 million square meters valued at \$71.5 million in 2011 from 7.10 million square meters valued at \$68.4 million in 2010. Mexico, China, Italy, Brazil, and Peru were the five leading sources of tile imports, with 45%, 12%, 8%, 7%, and 5% of the import volume, respectively. Imports of sanitaryware under the 4-digit HTS Code 6910 decreased to 22.5 million units in 2011 from 24.4 million units in 2010. China accounted for 10.9 million units or 49% of the U.S. sanitaryware imports in 2011, and Mexico accounted for 8.40 million units or 37% of the imports.

Imerys, the leading ball clay producer in the United States and globally, indicated that North American and some western European ceramic markets did not change significantly in 2011. The company increased sales in Eastern Europe, the Middle East, Brazil, India, and Southeast Asia, regions which exhibited stronger economic growth (Imerys SA, 2012, p. 20).

**Prices.**—The average unit value for ball clay reported by domestic producers was \$46 per metric ton compared with \$45 per ton in 2010. The average f.a.s. value for exported ball clay was \$59 per ton. The average Customs value for imported ball clay was \$318 per ton.

**Trade.**—Ball clay exports were 49,400 t valued at \$2.89 million in 2011 compared with 44,900 t valued at \$3.03 million in 2010, according to the U.S. Census Bureau (table 14). Producers exported about 208,000 t (table 3). Most of the difference in exports reported by producers and the U.S. Census Bureau involves shipments to Mexico, whose trade statistics suggested that Mexican imports of ball clay from the United States were reported under their Harmonized Tariff Standard code for kaolin and other kaolinic clays. The water weight of slurry shipments (about 30% to 35% of the shipment weight) also may account for a portion of the extra tonnage reported by producers. Ball clay imports were 465 t valued at \$148,000 (table 15).

**Outlook.**—Commercial and residential construction activity was tepid in 2011 but increased significantly through October 2012. Increased commercial and residential building construction results in an increased use of ceramic tile and sanitaryware, which were the leading markets for ball clay. The annualized rate of housing starts through October 2012 increased 23% and the annualized rate of construction spending through October 2012 increased 9.6% compared with those of October 2011 (U.S. Census Bureau, 2012a–c, undated). An excess of foreclosed homes available in many areas of the country and tight credit, however, may moderate growth in ball clay sales in 2012.

With the lingering effects of the recession, growth in global construction markets also is likely to be slow. Ball clay exports to Mexico, which supplies finished ceramic products to the United States, may increase slightly in 2012.

## Bentonite

**Production.**—In 2011, 21 companies produced nonswelling and (or) swelling bentonite in 11 States. About 4.81 Mt valued at \$327 million was sold or used in 2011, 5% more than the 4.60 Mt valued at \$266 million of bentonite sold or used in 2010 (table 4). Production of nonswelling bentonite was 123,000 t valued at \$9.55 million in 2011, unchanged from that of 2010. Alabama led in the production of nonswelling bentonite, followed by, in descending order of tonnage, Mississippi, Arizona, California, and Nevada.

Production of swelling bentonite was 4.68 Mt valued at \$317 million in 2011, an increase of 5% from 4.48 Mt valued at \$256 million in 2010. Wyoming led in the production of swelling bentonite, followed by Utah, Montana, Texas, California, Oregon, Nevada, and Colorado.

Elementis Specialties, Inc. (a subsidiary of Elementis plc) completed a multiyear expansion of its Newberry Springs, CA, plant. The \$6 million project included the installation of a new spray dryer system. The expansion will double the previous production capacity and be more energy efficient. Hectorite was sold for such products as cleaners, cosmetics, pharmaceuticals, paint, polishes, and waxes (Cejnar, 2011).

Wyo-Ben Inc. submitted plans to the Bureau of Land Management for a mine near Thermopolis, WY. Reserves at that deposit were expected to last 10 to 20 years. The mine will cover about 30 hectares during that time period but with cast-back mining methods, only 4 to 6 hectares would be disturbed each year (Groenenberg, 2011).

**Consumption.**—In 2011, domestic sales and use of bentonite increased 5% from that of 2010. Major domestic sales of bentonite were, in decreasing order by quantity, drilling mud (all swelling bentonite), pet waste absorbent (all swelling bentonite), pelletizing iron ore (all swelling bentonite), and foundry sand bond (more than 99% was swelling bentonite). Bentonite also was sold for civil engineering and sealing; fillers, extenders, and binders; waterproofing and sealing; and a variety of other applications (table 4).

The leading markets shown in table 4 are representative of those of swelling bentonite, which accounted for 97% of total bentonite sales. The leading uses of nonswelling bentonite were in foundry sand bond and water treatment and filtering.

Domestic sales of bentonite for pet litter were reported to have increased 15% in 2011 but that may be an artifact of better reporting by producers rather than an actual increase from 2010. A leading supplier to the pet litter market reported that sales decreased in 2011 (AMCOL International Corp., 2012, p. 33). Other suppliers reported only slightly higher sales for pet litter. Sales of bentonite for drilling mud, foundry sand bond, and pelletizing iron ore increased because of increases in oil drilling, industrial output, and steel production, respectively (Board of Governors of the Federal Reserve System, 2012; Virta, 2012; Baker Hughes Inc., 2013) (table 4).

For smaller markets, swelling bentonite accounted for more than 95% of the bentonite sold for adhesives; animal feed; clarifying and decolorizing animal, mineral, and vegetable oils and greases; cosmetics, medical, and pharmaceutical; fertilizers; miscellaneous ceramics; miscellaneous fillers and extenders; oil and grease absorbents; paint; and plastics. Swelling bentonite accounted for less than 50% of sales for water treatment and filtering.

In 2011, American Colloid Co. (a subsidiary of AMCOL International) reported increases in sales revenue for metal casting applications, its leading revenue market. Its foundry sales also increased with the continuing growth in the automotive and heavy-equipment markets and its basic minerals markets increased mainly on the strength of sales for gas and oil drilling and European agricultural sales. Increased revenue was a combination of higher prices and increased tonnage sales (AMCOL International Corp., 2012, p. 33).

Rockwood Holdings, Inc. (the parent company of Southern Clay Products, Inc.) reported increased sales in most of its clay-additive markets with oilfield applications experiencing the greatest growth. Revenues also increased because of higher clay pricing (Rockwood Holdings, Inc., 2012, p. 54).

**Prices.**—The average unit value reported by domestic producers for nonswelling bentonite was \$78 per metric ton in 2011 compared with \$76 per ton in 2010. The average value for swelling bentonite was \$68 per ton compared with \$57 per ton in 2010. The average value for all bentonite was \$68 per ton in 2011 compared with \$58 per ton in 2010, with generally higher unit values reported by most producers of swelling bentonite in 2011 because of increased costs and high demand. The average f.a.s. value of exported bentonite was \$163 per ton. The average Customs value of imported bentonite was \$787 per ton.

The price of bentonite that was sold in bulk, crude form in railcars for iron ore pelletizing from the mill in Wyoming was

\$61 to \$66 per ton; foundry-grade that was bagged and shipped in railcars was \$99 to \$127 per ton; and American Petroleum Institute (API)-grade bentonite that was bagged and shipped in railcars was \$86 to \$132 per ton. Crushed, dried, loose in bulk bentonite from India was \$34 to \$38 per ton for pet litter grade. Crude and dried bentonite, sold in bulk, free on board, European port, was \$54 to \$78 per ton for pet litter (Industrial Minerals, 2011).

The average annual producer price index (PPI) for bentonite under North American Industry Classification System (NAICS) code 212325C was 161.6 in 2011 (1984=100) compared with 157.8 in 2010. The PPI decreased during the year from 164.4 in March to 159.3 in April but slowly increased to 160.9 by December. The PPI measured the average change in the selling prices charged by domestic producers of bentonite over time (U.S. Bureau of Labor Statistics, undated).

**Trade.**—Bentonite exports increased to 1.02 Mt valued at \$167 million in 2011 from 953 Mt valued at \$143 million in 2010 (table 14). Canada and Japan accounted for the largest share of the increase in exports. Most of the increase was related to the improving economies with increased demand for bentonite by the iron ore, foundry, and oil drilling industries. Changes in trade with other countries were relatively minor. Domestic bentonite producers reported exports of 785,000 t (table 4). Much of the discrepancy between data reported by producers and the U.S. Census Bureau data probably resulted from producers including a portion of the exports destined for Canadian and Mexican markets under domestic sales. In addition, some bentonite is packaged domestically and then exported as a finished product, such as cat litter. Sales through U.S. mineral brokers, where producers do not know if the bentonite is used domestically or exported, could also explain part of the discrepancy.

Bentonite imports consisted mainly of untreated bentonite clay and chemically or artificially activated materials. Imports of untreated bentonite were 9,000 t valued at \$7.08 million. Imports of artificially activated material were 31,000 t valued at \$32.9 million (table 15).

**Outlook.**—After rebounding from the recession of 2008–09, the bentonite industry reached prerecession levels of consumption, mainly on the strength of the foundry sand and drilling mud markets. Other global markets for bentonite were relatively unchanged or declined slightly. Overall bentonite sales may increase slightly in 2012.

Growth in absorbent markets, particularly pet waste absorbents, declined during the past 2 years because of reduced consumer spending. With only a slightly better outlook for increased consumer spending anticipated in 2012, pet litter markets may remain unchanged or increase slightly. Sales of bentonite for oil absorbent applications may increase slightly in 2012 compared with those of 2011 based on a slight increase in U.S. industrial output in the manufacturing sector through July 2012 (Board of Governors of the Federal Reserve System, 2012).

Sales of bentonite for drilling mud applications may increase slightly in 2012 compared with those of 2011 because of increased drilling activity in 2012. Sales of bentonite also were tied to the iron and steel industries because of its use

for pelletizing iron ore and as a foundry sand bond. Through September 2012, shipments of iron ore increased slightly compared with that of the first 9 months of 2011 (Tuck, 2012). Demand for iron ore is likely to continue to increase in 2012 as global economies recover.

Two major suppliers of bentonite to the foundry industry indicated that the market increased in 2011 (AMCOL International Corp., 2012, p. 29; S&B Industrial Minerals S.A., 2012, p. 23). Additionally, manufacturing of durable goods increased through July 2012 compared with the same period in 2011 (Board of Governors of the Federal Reserve System, 2012). Consequently, sales of bentonite for foundry sand bond applications may increase slightly in 2012.

Sales of bentonite for civil engineering applications, such as waterproofing and sealing and landfill caps and liners, continued to be affected by reduced construction activity during the recession and may be unchanged or increase slightly in 2012. Other smaller markets for bentonite may increase slightly in 2012 as U.S. economic activity increases.

## Common Clay and Shale

**Production.**—In 2011, 135 companies produced common clay and shale for manufacturing products in 39 States and Puerto Rico. Companies that mined clay for construction fill and landfill caps and did not operate mills or plants were not included in the USGS canvass of the clay and shale industry. These companies operated in most, if not all, States.

Domestic sales or use of common clay and shale decreased slightly to 11.7 Mt valued at \$141 million in 2011 compared with 11.9 Mt valued at \$146 million in 2010 (table 5). The 10 leading producing States were, in descending order of tonnage, Texas, Alabama, North Carolina, Georgia, Ohio, Oklahoma, Arkansas, Virginia, Missouri, and California. These 10 States accounted for 64% of U.S. common clay and shale production.

The Belden Brick Co. (Canton, OH) purchased Lawrenceville Brick Inc., which operated two brick plants near Lawrenceville, VA, with a capacity of 115 million bricks per year. The purchase also included Lawrenceville Brick's clay reserves. The purchase increased Belden Brick's capacity to more than 500 million bricks per year (Mackinnon, 2012).

Acme Brick Co. (Ft. Worth, TX) purchased the assets of Jenkins Brick & Tile Co. LLC. Jenkins Brick operated three brick plants in Alabama and sales facilities in Alabama, Florida, Georgia, South Carolina, and Tennessee. The company also distributed ceramic tile and fabricated stone building materials. The purchase allowed Acme Brick, which marketed brick primarily in the Midwest, to extend its sales area to the Atlantic seaboard (Acme Brick Co., undated).

Mid America Brick & Structural Clay Products, LLC restarted its modernized Mexico, MO, plant and shipped its first load of bricks in July. The company operated one kiln with a capacity of 30 million bricks per year but planned to start up a second kiln in 2012, doubling its brick-making capacity (Sims, 2011).

**Consumption.**—Brick manufacture remained the leading market for common clay and shale, followed by, in descending order of tonnage, lightweight aggregate and portland cement. These three markets accounted for 91% of sales in 2011. Lightweight aggregate sales (2.85 Mt) were subdivided into

concrete block (42%), structural concrete (21%), highway surfacing (17%), and miscellaneous lightweight aggregates (20%). Other markets for common clay and shale included civil engineering, ceramic floor and wall tile, miscellaneous ceramics, heavy-clay (nonbrick) products, and refractory products (table 5).

**Prices.**—The unit average value for all common clay and shale produced in the United States was \$12 per ton, essentially unchanged from that of 2010. The value of clay and shale used to produce lightweight aggregate was estimated to be \$27 per ton in 2011 compared with \$30 per ton in 2010. Average prices for lightweight aggregate produced from clay and shale ranged from \$30 to \$80 per ton for most applications. Unit values for common clay and shale should be used with caution. Most producers do not sell their clay, but use it directly to manufacture products and have not established a selling price for their clays.

The annual average PPI for common (miscellaneous) clay and shale under NAICS code 212325B was 183 in 2011 (1984=100) compared with 176.6 in 2010. The PPI increased from 179.9 in January to 186 in December. The PPI measured the average change in the selling prices charged by domestic producers of common (miscellaneous) clay and shale over time (U.S. Bureau of Labor Statistics, undated).

**Outlook.**—Common clay and shale sales again were affected by the sluggish U.S. economy in 2011. The seasonally adjusted annual rate for housing starts, however, increased 23% through October 2012 and overall construction spending for commercial buildings increased 9.6% through October compared with those of October 2011 (U.S. Census Bureau, 2012a, c). Although mortgage foreclosure issues had lessened, tight credit and an excess of foreclosed homes available in many regions of the country may result in a moderate growth in common clay sales in 2012.

## Fire clay

**Production.**—Fire clay producers were mostly refractory product manufacturers that used the clays in firebrick and various heavy-clay products. In 2011, four firms mined fire clay in three States. Fire clay mined by domestic producers was almost unchanged with production of 215,000 t valued at \$6.16 million in 2011 and 216,000 t valued at \$6.12 million in 2010 (table 6). Missouri was the leading producing State, followed by, in descending order of tonnage, Colorado and Texas. Several common clay producers that occasionally mine fire clay indicated that they did not do so in 2011.

**Consumption.**—Consumption of fire clay decreased slightly in 2011. Leading markets for fire clay were, in descending order of tonnage, refractory calcines and grogs, portland cement, ceramic floor and wall tile, common brick, pottery, miscellaneous ceramics, and firebrick. Most data were withheld to avoid disclosing company proprietary data (table 6).

Fire clay also was sold for high-alumina brick and specialties; ramming and gunning mixes; refractory block and mortars; and refractory saggars. Fire clays also were used to produce such items as brick and pottery.

**Prices.**—In 2011, the average unit value for fire clay reported by domestic producers was \$29 per metric ton in 2011 compared

with \$29 per ton in 2010. The average f.a.s. value of exported fire clay was \$166 per ton. The average Customs value of imported fire clay was \$447 per ton.

**Trade.**—Exports of fire clay and refractory-grade kaolin appear to have been combined under the same HTS code in recent years. At least 43%, and possibly more, of the exports reported by the U.S. Census Bureau under the HTS code for fire clay was thought to be refractory-grade kaolin rather than fire clay based on the locations of ports from which the material was exported. In 2011, exports of fire clay and refractory-grade kaolin decreased to 371,000 t valued at \$61.6 million compared with 404,000 t valued at \$61.5 million in 2010 (table 14). In 2011, imports were 2,000 t valued at \$893,000 (table 15).

**Outlook.**—Major users of refractory products such as the aluminum, glass, iron, lime, and steel industries increased production in 2011 and maintained those levels through mid-2012, suggesting possible growth in demand for refractory products for their furnaces.

Sales of fire clay for construction-related products, such as brick, cement, lightweight aggregate, and tile, face the same issues as common clay and shale, a dependence on growth in the private housing and commercial construction sectors to support growth in heavy-clay markets. Sales of fire clay for these applications have been erratic in recent years, with producers of common clay venturing into and out of fire clay mining depending on their needs. Fire clay sales for heavy-clay products may increase slightly in 2012 compared with those of 2011 if construction activity continues to increase.

## Fuller's earth

**Production.**—In 2011, 12 companies produced fuller's earth in 10 States. Fuller's earth deposits consist mainly of palygorskite (attapulgitite) in Florida and southwestern Georgia and montmorillonite in middle Georgia and other States. Gelling grades of attapulgitite, used as thickeners in such items as drilling muds and paints, were mined in western Florida and near Attapulcus, GA. Sorbent grades of attapulgitite were mined a little further north near Ochlocknee, GA. Sorbent grades of attapulgitite were grouped with the montmorillonite variety of fuller's earth, whose major use also was for sorbent applications, in table 7 to be consistent with past reporting.

Gelling-grade attapulgitite was mined or sold in the Florida Panhandle and southwestern Georgia by two companies. Production data were withheld to avoid revealing company proprietary data, but production increased in 2011 compared with that of 2010, with a significant increase in production reported by the leading producer. Florida led in the production of gelling-grade attapulgitite, followed by Georgia.

Production of the sorbent-grade fuller's earth decreased 5% to 1.95 Mt valued at \$194 million in 2011 compared with 2.05 Mt valued at \$201 million in 2010 (table 7). Sorbent-grade fuller's earth was produced, in decreasing order of tonnage, in Georgia, Missouri, Virginia, Mississippi, California, Tennessee, Florida, Illinois, Kansas, and Texas. Georgia, Mississippi, Missouri, and Virginia accounted for 76% of U.S. production.

**Consumption.**—Consumption of sorbent-grade fuller's earth decreased in 2011. Pet waste absorbent was the leading market, followed by oil and grease absorbents; civil engineering;

clarifying, decolorizing, and filtering of animal, mineral, and vegetable oils and greases; fertilizer carriers; animal feed; pesticide carriers; miscellaneous ceramics; unknown uses; and paint (table 7).

Consumption of gelling-grade fuller's earth increased in 2011. The leading market was exports (unknown uses). Exports were followed by fillers, extenders, and binders which included, in decreasing order of tonnage, unknown filler and extender uses; pesticide carrier; paint; fertilizer carrier; animal feed; and cosmetic, medical, and pharmaceutical applications. Fillers and extenders were followed by drilling mud; clarifying, decolorizing, and filtering of animal, mineral, and vegetable oils and greases; and oil and grease absorbents.

Sorbent-grades dominated sales to most fuller's earth markets, but gelling-grades accounted for most of the sales of fuller's earth, in decreasing order of tonnage, for paint; drilling mud; and cosmetic, medical, and pharmaceutical applications.

Oil-Dri completed a \$9 million expansion of its Blue Mountain Production Co. facility in Mississippi. The expansion increased floor space and expanded automation of the production system, increasing productivity (Oil-Dri Corp. of America, 2011).

**Prices.**—The average unit value of gelling-grade fuller's earth was withheld to avoid disclosing company proprietary data but the value was unchanged from that of 2010. The average value of sorbent-grade fuller's earth was \$100 per metric ton in 2011 compared with \$98 per ton in 2010. The average f.a.s. value of exported fuller's earth was \$450 per ton. The average Customs value of imported fuller's earth was \$76 per ton.

**Trade.**—In 2011, exports increased slightly to 102,000 t valued at \$45.9 million compared with 100,000 t valued at \$35.4 million in 2010 (table 14). Imports of decolorizing earth and fuller's earth were 1,860 t valued at \$142,000 in 2011 (table 15).

**Outlook.**—Pet waste absorbent is the leading market for fuller's earth. This market has exhibited essentially no growth in the past 2 years, and domestic sales are likely to remain unchanged in 2012. The second leading market for fuller's earth is in oil and grease absorbents. These sales are tied to industrial output where increased heavy manufacturing and machining results in increased use of oil and grease absorbents. In early 2012, industrial output increased slightly, suggesting that 2012 sales of fuller's earth for oil and grease absorbent applications may increase slightly compared with those of 2011 (Board of Governors of the Federal Reserve System, 2012).

The acreage of corn planted increased in 2012. As a result, a major supplier indicated higher sales of fuller's earth as carriers and suspension agents in fertilizers and pesticides (Oil-Dri Corp. of America, 2012, p. 17; U.S. Department of Agriculture, 2012). Other uses for fuller's earth are relatively small in volume. Sales for clarifying, decolorizing, and filtering of animal, mineral, and vegetable oils and greases are dependent on the quality of the oil source, and sales tend to vary yearly rather than follow economic trends. Production of fats and oils increased in 2011 and Oil-Dri, a leading supplier of fuller's earth for fluid purification products, indicated that sales had increased in the first 4 months of 2012 (Oil-Dri Corp. of America, 2012, p. 19). Consequently, sales for fluid purification may increase slightly in 2012. Gelling-grade fuller's earth was sold for construction-

related filler and extender applications, such as in adhesives, asphalt emulsions, caulks, joint compounds, paint, and roof coatings. Sales of these products are constrained by the slow housing markets so sales of gelling grades for construction-related products may increase slightly in 2012. Sales for drilling mud applications may increase slightly in 2012 compared with those of 2011, based on increased global oil drilling activity in early 2012.

In general, any improvement in the U.S. economy will likely result in slightly improved sales for nonabsorbent applications for fuller's earth in 2012.

## **Kaolin**

**Production.**—In 2011, 19 firms mined kaolin in 8 States. Domestic production decreased by 3% to 5.77 Mt valued at \$817 million compared with 5.95 Mt valued at \$817 million in 2010 (table 8). The leading producer State was Georgia, followed by, in descending order of tonnage, South Carolina, Alabama, Texas, Nevada, Florida, North Carolina, and California.

About 37% of the kaolin produced was water washed, 22% was calcined, 15% was delaminated, 14% was airfloat, and 12% was unprocessed (table 8). Pigment-grade (low-temperature calcined kaolin) accounted for less than 50% of the tonnage of the total calcined kaolin sales. Sales of pigment-grade calcined kaolin were withheld to avoid revealing company proprietary data. Companies in Georgia accounted for nearly all the pigment-grade calcined kaolin produced in 2011. A small amount also was produced in Texas.

Georgia accounted for 93% of the kaolin production in the United States. Kaolin production in Georgia decreased slightly to 5.34 Mt valued at \$781 million in 2011 compared with 5.47 Mt valued at \$780 million in 2010. Approximately 40% of Georgia kaolin sold was water washed, 23% was calcined (high- and low-temperature calcined kaolin), 17% was delaminated, 10% was airfloat, and 10% was unprocessed in 2011 (table 9). Production in South Carolina increased significantly to 245,000 t valued at \$19.7 million in 2011 compared with 158,000 t valued at \$10.5 million in 2010 (table 10). One producer in South Carolina accounted for most of the increased production.

Imerys, one of the leading U.S. kaolin producers, completed construction of a plant at its Andersonville, GA, site to manufacture ceramic proppants for the gas and oil production industry. The \$60 million plant was designed with a capacity exceeding 100,000 t/yr (Imerys, 2012, p. 21).

**Consumption.**—Consumption of kaolin decreased in 2011 from that of 2010 (table 8). The major domestic markets for kaolin were, in descending order of tonnage, paper coating and filling (40% of domestic sales), refractory products and miscellaneous ceramics (16% each), and fiberglass and mineral wool (6%). Other smaller but significant markets were ceramics, catalyst manufacture, chemical manufacture, floor and wall tile, heavy-clay products (brick and portland cement), paint, plastics, and rubber. The leading export market for kaolin was in paper coating and filler (table 11). A similar market distribution was seen for producers in Georgia (table 9).

The sales distribution for South Carolina kaolin producers was, in descending order of tonnage, fiberglass, catalyst manufacture (included in ceramics in table 10), rubber, brick, adhesives, paper coating, portland cement, fertilizer, firebrick, plastics, sanitaryware, roofing granules, miscellaneous fillers and extenders, and miscellaneous ceramics. Much of the data for individual markets were withheld to avoid disclosing company proprietary data (table 10).

Paper coating and filling markets accounted for 50% of total (domestic and export) kaolin sales in 2011. Sales for paper markets decreased slightly in response to decreased manufacture of paper in the North America. Refractory products accounted for 12% of total kaolin sales in 2011, with sales increasing slightly because of a small improvement in U.S. industrial production. Other increases were distributed across many end-use markets.

**Prices.**—The average unit value of kaolin was \$142 per metric ton for all kaolin grades. The average value for airfloat was \$85 per ton; delaminated, \$147 per ton; unprocessed, \$53 per ton; and water washed, \$162 per ton. The unit value of water washed increased significantly as a result of higher values reported by one producer. All types of calcined kaolin combined were valued at \$185 per ton. The average f.a.s. value of exported kaolin was \$223 per ton. The average Customs value of imported kaolin was \$102 per ton.

The price of number 1 paper coating grades of kaolin from a plant in Georgia ranged from \$160 to \$215 per ton, and the price of number 2 paper coating grades varied from \$110 to \$171 per ton (Industrial Minerals, 2011).

The annual average PPI for ball clay and kaolin mining under North American Industry Classification System code 2123240 was 190.9 in 2011 (1984=100) compared with 184.1 in 2010. The PPI increased from 186 in January to 193.2 in December. The PPI measured the average change in the selling prices charged by domestic producers of ball clay and kaolin over time (U.S. Bureau of Labor Statistics, undated).

**Trade.**—Exports increased in 2011 to 2.49 Mt of kaolin valued at \$555 million compared with 2.47 Mt valued at \$537 million in 2010 (table 14). Producers reported exports of 1.44 Mt (table 11). Much of the kaolin exported to Canada and Mexico probably was reported under domestic consumption by U.S. producers. Sales through U.S. mineral brokers, where producers do not know if the kaolin is used domestically or exported, also could explain part of the discrepancy.

Kaolin imports were 549,000 t of kaolin valued at \$56.2 million in 2011 compared with 510,000 t valued at \$51.4 million in 2010 (table 15). About 95% of kaolin imports was from Brazil and was used primarily in paper coating applications.

**Outlook.**—Sales by the kaolin industry are likely to remain unchanged in 2012. In the United States, industrial production of paper, the leading market for kaolin, declined 2.9% through July 2012 compared with the same time period in 2011 (Board of Governors of the Federal Reserve System, 2012). Paper markets in Western Europe were weak while those in Southeast Asia and South America increased by 6% (Confederation of European Paper Industries, 2012, p. 11; Imerys, 2012, p. 34). Export sales of kaolin, primarily for paper use, may increase slightly, particularly to Asian markets.

U.S. industrial manufacturing output increased through mid-2012 (Board of Governors of the Federal Reserve System, 2012). Sales of kaolin used to manufacture such products as catalysts, chemicals, plastics, refractory products, and rubber may increase slightly in 2012.

A relatively new growth market for kaolin is ceramic proppants. The market for all proppants increased significantly in the past decade because of increased drilling and fracturing of gas- and oil-bearing formations to improve recovery (Beckwith, 2011). With the entry of Imerys into the market in 2012 and expansion by a current manufacturer of kaolin-based ceramic proppants, sales and use of kaolin for this market is likely to increase significantly in 2012 and 2013 (Carbo Ceramics Inc., 2012; Imerys, 2012, p. 22)

As with ball clay, common clay and shale, and some fire clay sales, kaolin also has been affected by the slowdown in residential and commercial construction. Sales into construction-related markets, such as caulks, fiberglass, floor and wall tile, paint, and sanitaryware, slowed and have not yet recovered to levels achieved prior to the 2008–09 recession. The outlook for these markets is improving with seasonally adjusted annual rate for housing starts increasing by 23% through November 2012 from December 2011. Overall construction spending for commercial buildings increased 9.6% from October 2011 to October 2012 (U.S. Census Bureau, 2012a, c). Imerys (2012, p. 20) reported improved sales for ceramics, sanitaryware, and tile in Brazil, Eastern Europe, India, the Middle East, and Southeast Asia but lower sales in North America. Sales of kaolin to construction-related markets may see moderate increases in 2012.

## World Review

World production of bentonite was approximately 10.3 Mt (table 16), and fuller's earth production was 3.21 Mt (table 17). Kaolin production was about 33.9 Mt (table 18), including ball clay from Australia, Ukraine, and various other countries, and crude kaolin ore production tonnages were reported by many countries. World sales of processed kaolin were estimated to be between 22 and 24 Mt, after accounting for processing losses and stockpiling and the inclusion of ball clay production under kaolin by some countries. The United States continued to be the leading supplier of processed clay for sale, followed by Turkey and Greece for bentonite, Spain for fuller's earth, and Brazil and the United Kingdom for kaolin. Spain led all countries in the production of sepiolite. Senegal was the leading producer of palygorskite (attapulgitite), followed by the United States. The rankings above were based on processed clay sold or used and not on crude ore production.

Clariant AG acquired 96.15% of the shares of Süd-Chemie AG, Munich, Germany (Süd-Chemie AG, 2011). Süd-Chemie AG was a major global supplier of bentonite with mines in China, Germany, Mexico, and Spain (Watts, 2011).

<sup>6</sup>Includes drain tile, flower pots, flue linings, sewer pipe, structural tile, and miscellaneous clay products.

<sup>7</sup>Includes firebrick, blocks and shapes, mortar and cement, grogs and calcines, and miscellaneous refractories.

<sup>8</sup>Includes exports, reported by producers; miscellaneous civil engineering and sealings; miscellaneous fillers, extenders, and binders; pottery; roofing granules; and other unknown uses.

TABLE 6  
FIRE CLAY SOLD OR USED BY PRODUCERS IN THE UNITED STATES, BY USE<sup>1</sup>

(Thousand metric tons and thousand dollars)

	2010		2011	
	Quantity	Value	Quantity	Value
Production	216	6,120	215	6,160
Use:				
Heavy-clay products and lightweight aggregates <sup>2</sup>	87 <sup>r</sup>	NA	87	NA
Refractories:				
Firebrick, block, shapes	19	NA	1	NA
Grog and calcines	W	NA	W	NA
Other refractories <sup>3</sup>	W	NA	W	NA
Miscellaneous <sup>4</sup>	109 <sup>r</sup>	NA	126	NA
Total	216	6,120	215	6,160

<sup>r</sup>Revised. NA Not available. W Withheld to avoid disclosing company proprietary data; included in "Miscellaneous."

<sup>1</sup>Data are rounded to no more than three significant digits; may not add to totals shown.

<sup>2</sup>Includes common brick, concrete block, portland cement, and structural concrete.

<sup>3</sup>Includes kiln furniture, mortar and cement, and miscellaneous refractories.

<sup>4</sup>Includes floor tile, wall tile, and other unknown uses.

TABLE 7  
FULLER'S EARTH SOLD OR USED BY PRODUCERS IN THE UNITED STATES, BY TYPE AND USE<sup>1</sup>

(Thousand metric tons and thousand dollars)

	2010		2011	
	Quantity	Value	Quantity	Value
Type:				
Attapulgite	(2)	(2)	(2)	(2)
Montmorillonite	2,050	201,000	1,950	194,000
Total	2,050	201,000	1,950	194,000
Use:				
Absorbents:				
Oil and grease absorbent	150 <sup>r</sup>	NA	167	NA
Pet waste absorbent	1,380	NA	1,280	NA
Animal feed	52 <sup>r</sup>	NA	54	NA
Fillers, extenders, binders <sup>3</sup>	122 <sup>r</sup>	NA	83	NA
Filtering, clarifying, and decolorizing <sup>4</sup>	80 <sup>r</sup>	NA	125	NA
Miscellaneous <sup>5</sup>	236 <sup>r</sup>	NA	213	NA
Exports, reported by producers <sup>6</sup>	23 <sup>r</sup>	NA	22	NA
Total	2,050	201,000	1,950	194,000

<sup>r</sup>Revised. NA Not available.

<sup>1</sup>Data are rounded to no more than three significant digits; may not add to totals shown.

<sup>2</sup>Withheld to avoid disclosing company proprietary data. Primarily gellant-grade fuller's earth. More information can be found in the "Fuller's Earth" portion of the production section of this report.

<sup>3</sup>Includes asphalt emulsions; medical, pharmaceuticals and cosmetics; paints; pesticides and related products; and other unknown uses.

<sup>4</sup>Includes mineral and vegetable oils and greases.

<sup>5</sup>Includes civil engineering, drilling mud, miscellaneous absorbents, and other unknown uses.

<sup>6</sup>Includes oil and grease absorbents, pet waste absorbents, drilling mud, paint, and other unknown uses.

<sup>1</sup>World totals, U.S. data, and estimated data are rounded to no more than three significant digits; may not add to totals shown.

<sup>2</sup>Table includes data available through July 26, 2012.

<sup>3</sup>In addition to the countries listed, Canada and China are thought to produce bentonite, but output is not reported, and available information is inadequate to make reliable estimates of output levels.

<sup>4</sup>Includes bentonitic clays.

<sup>5</sup>Reported figure.

<sup>6</sup>Year beginning March 21 of that stated.

<sup>7</sup>Montmorillite type bleaching clay.

<sup>8</sup>May include other clays.

TABLE 17  
FULLER'S EARTH: WORLD PRODUCTION, BY COUNTRY<sup>1,2</sup>

(Metric tons)

Country <sup>3</sup>	2007	2008	2009	2010	2011 <sup>e</sup>
Australia, attapulgite <sup>c</sup>	10,000	10,000	9,500	10,000	10,000
Guatemala	109	--	--	--	--
Italy <sup>c</sup>	3,000	3,000	3,000	3,000	3,000
Mexico	34,200	66,100	108,000	170,000 <sup>r</sup>	107,000 <sup>4</sup>
Morocco, smectite <sup>c</sup>	15,000	15,000	15,000	15,000	15,000
Pakistan <sup>c</sup>	12,900 <sup>4</sup>	10,500 <sup>r</sup>	10,500 <sup>r</sup>	15,000 <sup>r</sup>	17,000
Senegal, attapulgite	150,000 <sup>c</sup>	167,000	181,000 <sup>r</sup>	204,000	200,000
South Africa, attapulgite	68,400	69,900	54,400	85,300 <sup>r</sup>	92,000
Spain: <sup>c</sup>					
Attapulgite	20,000	20,000	20,000	20,000	20,000
Sepiolite	800,000	800,000	800,000	800,000	800,000
United States <sup>5,6</sup>	2,600,000	2,340,000	2,010,000	2,050,000	1,950,000 <sup>4</sup>
Total	3,720,000	3,500,000	3,210,000	3,370,000 <sup>r</sup>	3,210,000

<sup>c</sup>Estimated. <sup>r</sup>Revised. -- Zero.

<sup>1</sup>Excludes centrally planned economy countries and former such countries, some of which presumably produce fuller's earth but for which no information is available. Table includes data available through July 26, 2012.

<sup>2</sup>World totals, U.S. data, and estimated data are rounded to no more than three significant digits; may not add to totals shown.

<sup>3</sup>In addition to the market economy countries listed, France, India, Iran, Japan, and Turkey have reportedly produced fuller's earth in the past and may continue to do so, but output is not reported, and available information is inadequate to make reliable estimates of output levels.

<sup>4</sup>Reported figure.

<sup>5</sup>Sold or used by producers.

<sup>6</sup>Excludes attapulgite.

<sup>c</sup>Estimated. <sup>p</sup>Preliminary. <sup>r</sup>Revised. -- Zero.

<sup>1</sup>World totals, U.S. data, and estimated data are rounded to no more than three significant digits; may not add to totals shown.

<sup>2</sup>Table includes data available through July 26, 2012.

<sup>3</sup>In addition to the countries listed, China, Morocco, and Suriname may also have produced kaolin, but information is inadequate to make reliable estimates of output levels.

<sup>4</sup>Data for year ending June 30 of that stated.

<sup>5</sup>Reported figure.

<sup>6</sup>Includes crude and washed kaolin and refractory clays not further described.

<sup>7</sup>Dry weight.

<sup>8</sup>Kaolin sold or used by producers.
