The Republic of Botswana is a landlocked nation in southern Africa surrounded by Namibia to the west, South Africa to the east and south, and Zambia and Zimbabwe to the north. It covers an area of 600,379 square kilometers and supported a population of 1.6 million in 2001. The diamond sector, which continued to be the mainstay of the economy, accounted for about 35% of the gross domestic product, 45% of Government revenues, and 85% of export earnings. Botswana was the world’s largest producer of diamond by value. Copper, nickel, and soda ash production also played significant though smaller roles in the national economy. The mining and quarrying sector accounted for 8,300 jobs, or about 3% of the total formal sector workforce in 2001 (International Monetary Fund, 2002§).

The value of mineral production in 2001 was approximately $2.21 billion, of which diamond accounted for $1.94 billion, or 88%; copper-nickel-cobalt for $234 million; and soda ash for $40 million. The value of coal and salt production is about $12 million. For the major commodities, the value of production was approximately equal to the value of mineral exports. Diamond production increased by 13% between 1999 and 2001 to more than 26 million carats because of the new Orapa Mine expansion, which came onstream in May 2000. During this period, copper and nickel smelter production declined by 8% and 2%, respectively, affected chiefly by weak global demand and prices. Demand for most metals is typically cyclical and follows global business and economic cycles.

HIV/AIDS remained a major economic, health, and social problem for Botswana. At the end of 2001, Botswana had the highest infection rate in the world; 38.8% of adults between 15 and 49 years of age was infected by the disease, with 26,000 AIDS deaths in 2001. HIV/AIDS was having an increasing impact on overall economic growth and on agricultural and industrial productivity with 18% of the workforce expected to be lost to AIDS by 2005 and more than 30%, by 2020 (Joint United Nations Programme on HIV/AIDS, 2002§).

Government Policies and Programs

The Ministry of Minerals, Energy and Water Affairs has responsibility for coordinating development and operational activities in the energy, minerals, and water sectors. Specific program responsibilities are carried out by Ministry departments, which include Geological Survey Mineral Promotion, Mines and Water Affairs, and two parastatal organizations, Botswana Power Corp. and the Water Utilities Corp. Mining was governed by the Mines and Minerals Act No. 17 of July 1999, which was designed to promote new foreign investment in exploration and mine development. The new Act continues to vest all mineral rights in the State but has introduced a new “Retention License” that guarantees security of tenure from exploration to development but allows a company to retain its rights for a 3-year period, renewable once for not more than 3 years if then-current market conditions are not favorable to exploit the deposit. The Act sets out guidelines for prospecting and mining licenses, environmental protection measures, royalties, and mining taxation. The Government retains an option to acquire up to a 15% interest in new ventures on commercial terms, thus abolishing its previous free equity participation (News Africa.com, 2001§). Oil and gas exploration and development is governed by the Petroleum (Exploration and Production) Act of May 1983. Investment in diamond mining is subject to a negotiated agreement with the Government. The Precious and Semi-precious Stones (Protection) Act of 1969 provides for the protection of the precious stones industry and regulates dealings in precious stones and semiprecious stones.

Structure of the Minerals Industry

The Government maintained an equity position in most of the major mining companies, but the industry was operated, for the most part, on a privately owned, free market basis. In a 50-50 joint partnership with De Beers Centenary AG, Government-owned Debswana Diamond Co. (Proprietary) Ltd., which was the country’s largest mining company, Anglo American plc of the United Kingdom and Government held equity positions in several other major mining companies, which included the nickel-copper-cobalt producers Bamangwato Concessions Ltd. (BCL) (Government 35%; Anglo American, 23%) and Tati Nickel Mining Co. (Pty.) Ltd. (Anglo American, 43.35%; LionOre Mining International Ltd. of Canada, 41.65%; Government, 15%) and the soda ash company Botswana Ash (Pty.) Ltd. (Government, 50%; Anglo American, 21%). In June 2000, AngloAmerican sold its interest in Morupule Colliery (Proprietary) Ltd., which was the country’s only coal mine, for $2.8 million to Debswana, which then had a 93% controlling interest in Morupule. In addition to these major operations, the mining industry consisted of a number of medium- and small-scale mines that produced agate, aggregates, brickmaking clay, gold, and dimension stone.

Commodity Review

Metals

Cobalt, Copper, and Nickel.—BCL owned and operated the Phikwe, Selebi, and Selebi North cobalt-copper-nickel mines and a smelter at Selebi-Phikwe about 350 kilometers (km) northeast of the capital of Gaborone. In addition to treating its own ore, BCL toll-smelted concentrate and ore for Tati Nickel. During 2001, BCL produced 14,900 metric tons (t) of copper

1A reference that includes a section twist (§) is found in the Internet References Cited section.
and 12,600 t of nickel metal contained in concentrates; thus was
down from 16,300 t of copper and 13,400 t of nickel in
concentrates in 2000. High costs and weak metal prices led the
Government to commission a strategic review of BCL’s
operations in December 2001. The report will be due in March
2002 and will make recommendations on the future directions
of BCL, which had sufficient remaining resources to remain
open until 2010 (Murray, 2002). Reserves and resources as of
yearend 2001 at BCL, prorated from Anglo American’s 23%
share, totaled 29.1 million metric tons (Mt) of proved and
probable reserves at a grade of 0.87% copper and 0.76% nickel
plus additional measured and indicated resources estimated to
be 30.4 Mt at a grade of 0.74% copper and 0.62% nickel (Anglo
American plc, 2002§).

Tati Nickel Mining Company (Pty.) Ltd. (Tati) operated the
Phoenix open pit nickel-copper mine, the Selkirk underground
mine, and a magnetic separator plant near Francistown. During
2001 production at the Selkirk Mine was reduced to one-half
capacity at 30,000 metric tons per year (t/yr) of ore feed as the
deposit neared depletion. The mine was scheduled to be closed
by mid-2002. The Phoenix Mine and dry magnetic separation
plant treated 1.7 million metric tons per year (Mt/yr) of ore to
produce 120,000 t/yr of nickel concentrates for direct smelting
at the nearby BCL smelter. Construction of the $66 million
Phoenix expansion project began in early 2001 and was
expected to be completed by mid-2002. The project involved
development of the infrastructure needed to bring in the electric
power and water needed to support a conventional flotation and
concentration plant and doubling of mine capacity to 3.6 Mt/yr
of ore feed. LionOre was also pilot testing its new proprietary
Activox process for the hydrometallurgical oxidation of sulfide
minerals which it felt would increase recoveries of copper,
nickel, and platinum-group elements at Tati. The Activox
process was a combination of fine grinding followed by
pressure oxidation under mild conditions. Tati Nickel produced
6,304 t of nickel, 2,157 t of copper, 26 t of cobalt, and 4.4
kilograms (kg) of gold in 2001, all of which were significantly
lower than those of 2002 as the Selkirk operation began to
phase out. During 2001, the Phoenix Mine produced 124,564 t
of concentrates at a grade of 5.91% nickel and 1.67% copper,
and the Selkirk Mine delivered 31,341 t of ore at a grade of
2.6% nickel and 1.42% copper. The company also received
byproduct credits for gold, palladium, platinum, and silver. As
of December 31, 2001, mineral resources, almost entirely in the
Phoenix open pit, were reported to be 165.6 Mt at a grade of
0.29% nickel and 0.20% copper, of which the mineral reserve
component was 46.6 Mt at a grade of 0.56% nickel and 0.34%
copper (LionOre Mining International Ltd., 2002§).

Gold.—Gallery Gold Limited of Australia, in which Lion
Selection Group Limited of Australia held a 43% interest, held a
significant land position in the Vumba and Tati greenstone Belts
in eastern Botswana. Although the Mupane Gold deposit,
which is located about 30 km southwest of Francistown, was its
most advanced prospect, Gallery was also exploring the
Tekwane area, near the Selkirk Mine, for platinum and nickel
and for kimberlite pipes in the region. A positive prefeasibility
study on the Mupane gold deposit was completed in early 2002.
Capital costs for the development of the Mupane gold project
were estimated to be $25 million. The study proposed two open
pits at Kwen and Tau with additional mill feed coming from the
nearby Signal Hill gold deposit. The study proposed two plant
sizes of 750,000 t/yr of ore feed and one treating 1 Mt/yr. Gold
recovery would range from 3,110 to 3,732 kilograms per year of
gold depending on mill size. Ore reserve drilling was
completed in September 2001, with results expected by
December 2002. Gallery anticipated that reserves would be
about 21,800 kg of gold and was continuing exploration to
identify an additional 6,200 kg of gold resources. The final
feasibility study was expected to be completed by March 2003
with the first gold pour anticipated by July 2004 (Lion Selection
Group Limited, 2002§).

Another Australian junior Tawana Resources NL, which was
evaluating the alluvial deposit at Somerset, which is located in
the Vumba Greenstone belt near Francistown. Studies indicate
a total mineral resource containing 1 Mt of superficial gravel.
Tawana are carrying out several bulk samples to obtain an
overall grade for the deposit. Previous workings reported an
average grade of 2.85 grams per metric (g/t) of gold.
Extensions of the Kraaipan greenstone belt into southern
Botswana from South Africa remain the focus of exploration by
Ashanti Goldfields Corp. (MBendi Information Services (Pty.
Ltd., 2002§).

Industrial Minerals

Diamond.—The major news of the year involved the
delisting of De Beers Centenary AG (De Beers) in June from
the Johannesburg Stock Exchange and its conversion to a
privately owned company in a transaction valued at $19 billion.
The restructured De Beers was owned by DB Investments
(45%) (an Oppenheimer family consortium), Anglo American
(45%), and the Government of Botswana (10%) (Namibia
Economist, 2001§). During 2001, Debswana recovered
13,056,000 carats at an average value of $110 per carat from the
Orapa Mine, 12,339,000 carats of diamond at an average
value of $50 per carat from the Jwaneng Mine, 1,021,000 carats at an
average value of $180 per carat from the Letlhakane Mine
(Terraconsult, 2002§). Sales of diamond from mine production
and stocks declined slightly to 25,244 carats in 2001 compared
with 25,737 carats in 2000. Production was sold through the De
Beers Diamond Trading Company (formerly the Central Selling
Organization). Debswana owned subsidiaries for diamond
sorting and valuation (Botswana Diamond Valuing Co.) and for
value-added cutting and polishing diamond (Teemane
Manufacturing Co.). Diamond production will level off at
between 26 million and 27 million carats per year after the full
commissioning of Debswana’s new Damtshaa Mine. The $38
million project will begin production in October 2002 with full
production of around 700,000 carats per year of diamonds
expected by March 2003. At the current design rate of 200
metric tons per hour of ore treated, the Damtshaa project life
expectancy could be 32 years (Debswana Diamond Company,
2001§).

De Beers held a 60% interest in the Botswana Gope
Exploration Company that discovered diamond at Gope in the
Central Kalahari Game Reserve during the late 1990s. De
Beers, which has abundant diamond resources in its other
Botswana properties, placed the project on hold pending public
discussion on the aboriginal rights of local Bushmen tribesmen
who live in the area and the environmental impact of mining in
a game reserve (Mogapi, 2001§).
Salt and Soda Ash.—After having recovered from the disastrous floods, financial liquidation, and restructuring of the late 1990s, Botswana Ash (Botash) continued to operate its brine mining and treatment facility at Sua Pan, which is located 173 km northwest of Francistown. Recovering from the heavy rains of 2000, Botash increased production of soda ash by more than 31% to 251,231 t in 2001; production of salt declined to 178,646 t from 184,753 t in 2000. Botash pumped salt brines from nearly 100 wells to nearby large evaporation ponds at a rate of about 2,400 cubic meters per hour. More than 300 metric tons per day of carbon dioxide recovered from an associated coal cogeneration plant was used in carbonation of the brines to produce the soda ash. Finished products were railed to Francistown for shipment to markets in South Africa, Zambia, and Zimbabwe (Tassel, 2002$).

In February 2001, the South Africa Competition Commission ruled in favor of Botash in a long standing trade dumping case against the America Natural Soda Ash Corp. (Ansac), which was a joint venture of a number of U.S. soda ash producers that were selling into the South Africa market. Botash claimed that Ansac was selling soda ash into South African markets below the price charged to U.S. consumers and that this contributed to the financial liquidation of its predecessor company in 1995. Ansac will appeal the ruling (Cohen, 2001$).

Mineral Fuels

Coal.—Morupule Colliery had a production capacity of about 1 Mt/yr. Between 1998 and 2001, it operated at a fairly consistent rate of 93% to 94% of capacity. Most of its output fed the nearby Botswana Power Corp. thermal powerplant at Morupule, which supplied more than 50% of Botswana’s electricity requirements, or about 1,060 kilowatthours of energy. Other customers included the nickel and soda ash companies. The coal that was extracted underground from a 12-foot seam by using mechanized room-and-pillar-mining was sent to the surface on shuttle cars on an inclined ramp and was then conveyed to the Morupule powerplant. Reserves in the Morupule field were estimated to be 8 billion metric tons of steam coal with 18% to 24% ash and a calorific value of 23 to 25 megajoules per kilogram (Ministry of Minerals, Energy and Water Affairs, 1999$; Debswana Diamond Company, 2002$).

Infrastructure

Transportation facilities were good on the eastern fringe of the country. The 850-km trans-Kalahari highway connected Gaborone, Botswana, to Gobabis, Namibia. Highways also connected landlocked Botswana with South Africa and Zimbabwe. A single-track railroad, which was operated by Botswana Railways, runs from north to south through the eastern part of the country and connects with the South African and the Zimbabwean rail systems. During 2001, additional investment on water and power infrastructure was made by Tati Nickel as part of its Phoenix Mine expansion.

Outlook

Revenues from diamond mining and cutting are expected to continue to be the mainstay of the economy for the foreseeable future with Debswana’s identified diamond resources sufficient to maintain 2001 production levels for at least 25 to 30 years. Production of nickel and copper, which is the jointly mined commodities that earned the second largest amount of foreign exchange, have a more limited life and are expected to continue to be around 25,000 to 30,000 t/yr of nickel until the expected end-of-life of the BCL Ltd. operations at Pikwe-Selebi in 2011; the mine life of the Tati nickel operations is projected to last until at least 2017. The country’s favorable geologic environment, mineral investment climate, political stability, and low tax rates are expected to continue to make Botswana a target for foreign mineral investment. Incentives provided in the new Mining Law of 1999 were aimed at helping the Government diversify the national economy and reduce its reliance on the diamond industry.

e/ Estimated.

1/ Table includes data available through October 2002.
2/ In addition to commodities listed, clay (for brick and tile) and silver were produced, but information was inadequate to estimate output.
3/ Smelter product was granulated nickel-copper-cobalt matte.
4/ Included some product from direct smelting of ore; that is, ore not reported as milled.
5/ Assumed to contain about 70% gem and near gem.
6/ Principally agate. Reported as sales.
7/ Reported as bullion; historically included silver estimated to be about 2%.
8/ From natural soda ash production.
9/ Additional production of sand and gravel from small local operations was periodically reported, but information was inadequate to estimate output.
