The Mineral Industry of Mexico

By Alberto Alexander Perez

In 2011, Mexico’s economy in terms of the gross domestic product (GDP) was the second largest in Latin America after that of Brazil. Mexico’s GDP based on purchasing power parity (PPP) was $1.694 trillion in 2011, which was about a 4% increase from that of 2010. Mexico’s official unemployment rate was 4.5%, although underemployment as defined by the U.S. Central Intelligence Agency may have been as high as 25% (U.S. Central Intelligence Agency, 2013).

The mineral industry was a significant economic sector of the country and represented a major source of revenue for the Government. The continued recovery in the prices of mineral commodities along with the increase in mineral demand led to a 45% increase in the value of mineral production in 2011 compared with that of 2010, reaching the highest level ever at $20.148 billion. Employment in the mineral industry increased in 2011 as a result of the creation of about 26,000 new jobs in the industry.

The leading mineral-rich areas where copper, gold, silver, and zinc were produced (although not exclusively) are located in the north and the west-central parts of the country. The main oil producing areas are located in the east and south (Camara Minera de Mexico, 2012, p. 6, 25–26; U.S. Central Intelligence Agency, 2013).

Mexico was a leading world producer of several mineral commodities. In 2011, the country was the world’s leading producer of silver, the second ranked producer of fluor spar, and the third ranked producer of bismuth, celestite, and sodium sulfate. Mexico also was the 4th ranked producer of wollastonite; the 5th ranked producer of cadmium, diatomite, lead, and molybdenum; the 7th ranked producer of gypsum and zinc; the 8th ranked producer of barite, graphite, and manganese; the 9th ranked producer of salt; the 10th ranked producer of copper ore and gold; the 14th ranked producer of iron ore; and the 15th ranked producer of phosphate rock and sulfur (Brooks, 2012a, b; Camara Minera de Mexico, 2012, p. 73; Carlin, 2012; Corathers, 2012; Guberman, 2012; Kostick, 2012; Miller, 2012; Pol yak, 2012; Tolcin, 2012a, b).

Minerals in the National Economy

The mineral industry was an important source of foreign currency for the country. Of the total mineral industry production in Mexico in 2011, silver accounted for a 26% share, by value, followed by gold (22%); copper (18%); zinc (7%); iron, gravel, and sand (3% each), and other minerals (18%) (Camara Minera de Mexico, 2012, p. 14).

Government Policies and Programs

Natural resources, and minerals in particular, are considered part of the national patrimony of Mexico under its Constitution. Article 27 deals with issues of ownership and exploitation of natural resources; however, the mining law that became effective in 1992 and was subsequently modified and expanded in 1996 and again in April 2005, clarifies and spells out the legal framework for the exploration, production, and processing of the country’s mineral resources. The law allows a 100% private equity ownership stake in the exploration, production, and development of mineral resources, including resources previously reserved for direct Government exploitation, such as coal, iron, phosphorus, potassium, and sulfur. Oil and its derivatives, as well as radioactive materials, are not covered in this law. Exploration concessions are granted for 6 years and are not renewable. Production concessions are awarded for 50 years and are renewable for an additional 50 years (Camara de Diputados del H. Congreso de la Union, 2006, p. 1–33).

The mining law was revised to decrease the number of administrative procedures and establish time limits for most of the procedures. The public service manual of mining-related issues, which was published in July 1999 and is still in effect, spells out the established regulations and administrative procedures for all mining matters (Secretaria de Economia, 1999).

The mining sector is administered by the Secretaria de Economia. The Direcccion General de Minas is the organization in charge of making revisions to the mining law and its regulations, as well as granting concessions and titles.

Another important law concerning all of Mexico’s natural resources is the Law of Foreign Investment. This law regulates the degree and form of foreign investment in Mexico, and, in particular, in the natural resources sector, which is an area that was previously barred from foreign investment and ownership. This law was published in 1993 and has been revised and amended by decrees in 1995, 1996, 1998, 1999, and, most recently, in 2000. In particular, Articles 10 through 14 deal with foreign investment in the mineral sector and the development and exploitation of geographic areas considered restricted by the Government (Camara de Diputados del H. Congreso de la Union, 2012, p. 1–34).

The General Law of Ecological Balance and Environmental Protection (LGEEPA), which is the keystone of the country’s environmental law, was passed in 1988. Those environmental responsibilities that had resided in various Government agencies were transferred to the Secretaria de Medio Ambiente, Recursos Naturales y Pesca (SEMARNA P) in 1994. In 2000, the agency became the Secretaria de Medio Ambiente y Recursos Naturales (SEMAR NAT). Under SEMARNAT, mineral exploration and mining require a number of environmental permits and authorizations to conform to the statutes of the LGEEPA. These requirements include a preliminary environmental impact statement for all major activities of the projects. The SEMARNAT also requires all mines and plants to have an operating license, as well as permits for explosives, hazardous materials handling, land use, water discharge, and well usage. Other regulations are concerned with dumps and tailings,
electrical transformers, gas and dust emissions, noise, and the storage of oil and fuel.

The regulation of environmental impact statements was initiated in 2000. Under the new rules, environmental impact reports for beneficiation plants, gas and oil pipelines, and mines must be approved by the SEMARNAT. According to this agency, the level of sites considered contaminated with dangerous byproducts, including from mining and manufacturing, remained stable since 2006 at 330 registered sites; however, this was an increase from 297 registered sites in the period from 2000 through 2004. In their index of the physical volume of production of dangerous residuals produced by the mining sector, the SERMANAT estimated that, since 2000, the level of dangerous residuals (measured in terms of the total value of production) had increased by 8%. In total volume of production, this was still lower than that produced by the manufacturing sector; however, the rate of growth of dangerous residuals produced by the manufacturing sector was lower at about 5% of the total value of production (Secretaria de Medio Ambiente y Recursos Naturales, 2008).

Production

Mexico’s mineral production levels in 2011 generally increased in comparison with the levels of production in 2010. The principal increases were in the production of dolomite (which increased by 85.7%) followed by marble (77.6%), copper mine ore in content (69.4%), celestite (29.4%), coke (28.7%), coal (25.8%), gold (22.1%), lead (16.5%), and silver (8.3%), among others. Of note is the production of talc, which had diminished to almost zero production but in 2011 had a reported production of 51,221 metric tons (t) (table 1). Mineral commodities for which production decreased during the year included refined zinc (by 37.1%), fuller’s earth (36.9%), calcite (25.7%), common clays (15.3%), ferromanganese (8.64%), and iron ore (8.52%) (table 1).

Crude oil production by Petroleos Mexicanos S.A. de C.V. (PEMEX), which was the state-owned oil monopoly, decreased by 1.0% to about 930 million barrels (Mbbl). Gross natural gas production also decreased to 68.15 billion cubic meters (table 1; Petroleos Mexicanos S.A. de C.V., 2012, p. 4).

Structure of the Mineral Industry

A few large domestic companies produced a significant portion of Mexico’s mineral output, including Cementos Mexicanos S.A.B. de C.V. (CEMEX), Compañía Minera Autlán S.A. de C.V. (Minera Autlán), Empresas Frisco S.A. de C.V. (Frisco), Fresnillo plc., Grupo Acero del Norte S.A. de C.V. (GAN), Grupo Mexico S.A. de C.V. (Grupo Mexico), and Industrias Peñoles S.A. de C.V. (Peñoles). Medium- and small-size companies produced many of the industrial minerals. State-owned PEMEX controlled the crude petroleum, refining, and natural gas production sector (table 2).

The Secretaría de Economía reported that, in 2011, there were a total of 288 companies involved in 808 projects that had direct foreign investments in Mexico. Of these companies, 206 had their central offices in Canada and 46 were headquartered in the United States; 8, in China; 7, in Australia; 4 each, in Japan and the Republic of Korea; 3, in the United Kingdom; 2 each, in India and Peru; and 1 each in Belgium, Chile, Italy, Luxembourg, the Netherlands and Spain. Precious metals, particularly gold and silver, were the primary targets for 500 of these projects (Secretaría de Economía, 2012a, p 534–537).

Mineral Trade

In 2011, Mexico was a net exporter of nonfuel minerals, in terms of value, registering a trade surplus of $12.40 billion. This surplus was mostly because the country was a net precious minerals exporter in 2011, as it had been for the past several years, and the value of its precious metals exports increased by 49.7% compared with those of 2010 (Secretaría de Economía, 2012a, p. 19).

Mexico’s principal export partners were the United States and Canada (which were fellow members of the North America Free Trade Agreement) and also, in order of the value of trade, Spain, Japan, the Republic of Korea, Germany, Canada, and Brazil (U.N. Comtrade, 2012).

China had eight companies with investments in the Mexican mineral industry, China’s influence as a destination for Mexican mineral exports, however, was considerable.

Commodity Review

Metals

Copper.—In 2011, the volume of Mexican mine copper production increased by 69.4% compared with that of 2010. Ninety-four percent of all copper production took place in the following states: Sonora (80%), Zacatecas (9%), and San Luis Potosí (5%).

Work continued at the Buenavista Mine, which was owned by Buenavista del Cobre S.A. de C.V. (a fully owned subsidiary of Grupo Mexico), for the optimization of its solvent extraction-electrowinning operations; construction was expected to be finished in the second quarter of 2012. The objective of the optimization was to increase the volume of production and reduce extraction times. Progress continued at the El Boleo Mine project at Santa Rosalia in the State of Baja California. El Boleo was owned by Alianza Estratégica Baja Mining (70%) and Consorcio Coreano (30%). The project was expected to produce 38,000 metric tons per year (t/yr) of copper during its projected life of 23 years. It was also expected that the mine would produce cobalt, manganese, and zinc sulfate. Production at the mine was scheduled to start in the first quarter of 2013. The Chinese company Jinchuan Group continued with its development of the Bahueraichi project. The previous owner of the project, Tyler Resources Inc., had estimated that the Bahueraichi project would have a capacity of 80,000 t/yr of copper once in production and that it would also produce significant volumes of gold, molybdenum, silver, and zinc (Camara Minera de Mexico, 2012, p. 120–122).

Gold.—In 2011, the value of gold production in Mexico reached 22% of the total value of the mineral industry in Mexico.
Mexico’s gold mine output, in terms of gold content, was 88,648 kilograms (kg), which was an increase of 22.1% compared with production in 2010 and the highest level of production ever for the country (table 1; Secretaría de Economía, 2012a, p. 19).

In 2011, the State of Sonora produced 31% of the national mined gold output, and it increased its volume of production by 22% compared with that of 2010. La Herradura Mine and the Soledad Dipolos Mine, which were owned by Fresnillo plc. and located in Sonora, together produced 15,116 kg, which was more than 50% of Sonora’s production. The State of Zacatecas produced 19% of the mined gold output (by volume) in Mexico in 2011. Production by the State of Zacatecas increased by 3% compared with that of 2010 because of increased production at the Peñasquitos Mine (owned by Goldcorp Inc. of Canada) and the Sauco Mine (owned by Fresnillo). The State of Chihuahua was the third ranked State in terms of the volume of gold production in Mexico in 2011, producing 17% of the total national mined gold output. Goldcorp owned El Sauzal Mine in the State of Chihuahua, which produced 3.16 t (a decrease of 34.9% compared with that of 2010, and continuing the trend expected as the mine was thought to be reaching the end of its life).

Fresnillo produced 3.64 t at its La Cienega Mine in the State of Durango. Alamos Gold Inc. of Canada produced 4.90 t at its Mulatos Mine in the State of Sonora. The Cerro San Pedro Mine in San Luis Potosí, which was owned by Minera San Xavier S.A. (a subsidiary of the Canadian company New Gold Inc.) produced 4.48 t of gold for the year. Coeur d’Alene Mines Corp. of the United States reported that its Palmarejo Mine, which is located in the State of Chihuahua, produced 3.89 t (Cámara Minera de México, 2012, p. 124–126).

Iron and Steel.—According to the Cámara Minera de México (CAMIMEX), Mexico does not have significant iron ore reserves; however, its production and reserves are sufficient to meet national demand (Cámara Minera de México, 2011, p. 22). In 2011, Mexico produced 12.81 million metric tons (Mt) of iron ore, which was 8.52% less than in 2010. Production was from the States of Colima, Durango, and Michoacán.

Iron ore exports to China increased by more than 1 Mt in 2010 compared with those of 2009 (the latest year for which data were available), and this trade was mostly done by private traders and mineral commodity consolidators. Most of the ore was shipped through the Ports of Lazaro Cardenas in Michoacán and Manzanillo in Colima (Cámara Minera de México, 2011, p. 22).

Crude steel production increased by 8.32% and pig iron production decreased by 1.85% compared with production in 2010. Mexico produced 18.10 Mt of crude steel and was the 13th ranked producer of steel, by volume, in the world in 2011. Altos Hornos de México S.A. (AHMSA), ArcelorMittal of Luxembourg, DeAccero S.A. de C.V., and Ternium S.A. were the principal steel producers in the country and together accounted for 79.5% of Mexico’s total crude steel production (table 1; Cámara Minera de México, 2011, p. 24; World Steel Association, 2012).

Lead.—In 2011, the output of lead mine production in Mexico increased by 16.5%; however, primary metal production decreased by 8.34%. According CAMIMEX, the total value of lead production in 2011 amounted to 26% more than in 2010.

Mexico was the world’s fifth ranked producer of lead in 2011 (table 1; Cámara Minera de México, 2012, p. 131).

Goldcorp’s Peñasquitos Mine was the leading lead mine in Mexico in terms of lead content production. In 2011, Peñasquitos produced 84,800 t of lead.

Industria Peñoles continued to be a major producer of lead in Mexico and had an output of 16,500 t in 2011 from its principal mine, the Naica, which is located in the State of Chihuahua. The Santa Barbara Mine, which is also located in Chihuahua and was owned by Grupo Mexico, produced 15,300 t of lead in 2011 (table 1; Secretaría de Economía, 2012b, p. 338–340).

Molybdenum.—Molybdenum production in the country decreased slightly (by less than 1%) to a total of 10,800 t in 2011. In terms of the value of molybdenum production, there was a decrease of 5% compared with that of 2010 owing to the decrease in the volume of production and the variation in international prices.

Grupo Mexico owned La Caridad Mine in the State of Sonora, which produced 98% of all molybdenum in the country. Most of La Caridad Mine’s output was processed into molybdenum trioxide at the facilities in Cumpas, State of Sonora, mostly for export (table 1; Cámara Minera de México, 2012, p. 133).

Silver.—Mexico was the leading silver producer in the world in 2011, accounting for 20% of world silver production. Mexico’s silver mine output was 4,780 t, which was a historic high for the country and represented an increase in production of 8.32% compared with that of 2010 (table 1).

The Fresnillo Mine, which is located in the State of Zacatecas, remained the richest silver mine in the world; it produced 1,125 t in 2011 and accounted for 24% of all silver produced in the country (Cámara Minera de México, 2012, p. 128). Goldcorp’s Peñasquitos Mine produced 719 t of silver and was the second ranked producer of silver, in terms of the volume of output, in Mexico after Fresnillo.

The Canadian company Pan American Silver Corp. owned the Alamo Dorado Mine, which is located in the State of Sonora, and La Colorada Mine, which is located in the State of Zacatecas. Alamo Dorado began operations in 2007 and produced 191.4 t of silver in 2011; La Colorada produced 146.3 t. The Canadian firm First Majestic Silver Corp. was also a significant silver producer in Mexico. The company’s mines (La Encantada in the State of Coahuila, San Martin in the State of Jalisco, and La Parrilla in the State of Durango) produced a combined 203 t in 2010 (the latest year for which data were available) (Cámara Minera de México, 2011, p. 15; 2012, p. 127–128).

Zinc.—Production of zinc metal in Mexico decreased by 37.10% in 2011 compared with that of 2010, and the level of zinc mine output increased by 10.85%. The decrease in refined zinc was a reflection of the demand and variation in prices compared with those of the previous year (Cámara Minera de México, 2012, p. 131; Secretaría de Economía, 2012a, p. 361). Goldcorp’s Peñasquitos Mine produced about 74,000 t of zinc in 2011 and was the leading zinc mine in Mexico. The Charcas Mine in the State of San Luis Potosí, which was owned by Minera Mexico S.A. de C.V., was the second ranked producer of zinc in the country, producing 53,200 t in 2011. Industrias Peñoles’ Bismarck Mine in Chihuahua produced 47,800 t, which
made it the third ranked zinc producing mine in the country (Camara Minera de Mexico, 2012, p. 131).

Industrial Minerals

Mexico was among the world’s top 10 producers of industrial minerals. The value of the country’s production of industrial minerals in 2011 increased by 13% compared with that of 2010 (table 1; Camara Minera de Mexico, 2012, p. 145).

Based on the value of production, the following nonmetallic minerals had the largest increases in 2011, in order of increase: dolomite (92%), sulfur (77%), sodium sulfate (56%), celestite (26%), magnesium sulfate (20%), kaolin (15%), graphite (14%), and diatomite (5%). In terms of the volume of output, production of fuller’s earth dropped by 36.9% in 2011 compared with that of 2010. Decreases in the volumes of production were also reported for calcite, by 25.72%; limestone, by 15.98%; common clay, by 15.3%; and gravel, by 10.19% (table 1; Camara Minera de Mexico, 2012, p. 145).

The Rofomex phosphate rock mine, which is located in San Juan de la Costa in the State of Baja California Sur and which was operated by Roca Fosforica de Mexico (a subsidiary of Grupo Fertinal S.A. de C.V.), was reactivated in 2007. Production of phosphate rock at the mine increased by 1,960% in 2008 compared with that of 2007. By 2011, production had continued to increase but at a slower pace, recording an increase of 12.15% in 2011 compared with that of the previous year. The mine had been inactive between 2001 and 2007 owing to damage to the installations by Hurricane Juliette and later because of litigation between Fertinal and its insurers (table 1; Insurance Journal, 2007).

The municipality of Mulegé, which is located in the State of Baja California Sur, was where more than 55% of the national production of gypsum took place. The principal producer of gypsum in Mexico was Compañía Occidental Mexicana S.A. de C.V (tables 1, 2; Camara Minera de Mexico, 2011, p. 137).

Mineral Fuels

Coal.—Mexico’s production of coal in 2011 totaled 34.7 Mt, which was an increase of 25.8% compared with that of 2010. The main companies that produced coal in Mexico were Carbonifera San Patricio S.A. de C.V., Grupo Acerero del Norte S.A. de C.V. (GAN), Grupo Mexico, and Materiales Industrializados S.A. de C.V. (Minsa). In 2010 (the latest year for which data were available), the distribution of production among the main concession holders was as follows: GAN (84%), Minsa (13%), Grupo Mexico (1.8%), Carbonifera San Patricio (about 1%), and Energía y Minería del Noroeste S.A. de C.V., the remaining 0.2% (table 1; Camara Minera de Mexico, 2011, p. 22; 2012 p. 141).

Crude Petroleum and Natural Gas.—Although demand for petroleum had increased, crude petroleum production by PEMEX had been decreasing in the past several years, partly owing to Mexico’s declining reserves and partly owing to a past history of lack of investment, exploration, and development of new projects. In 2011, production decreased by 1% to about 930 Mbbl. Gross natural gas production also decreased by 6.14% to 68.15 billion cubic meters (table 1; Petroleos Mexicanos S.A. de C.V., 2012, p. 4).

Outlook

The year 2011 continued the trend of recovery started in the previous year, particularly in the metals sector. This sector represented the most dynamic and profitable part of the mineral industry. Gold and silver exploration is set to continue, and new projects are slated to reach their productive stages in 2012. Industrial minerals are expected to continue to play an important role in Mexico’s exports and imports.

The mineral industry as a whole represents a very important source of foreign currency for Mexico, competing with the oil industry, tourism, and remittances by nationals living abroad. This trend is expected to increase as the prices of such commodities as copper, gold, and silver increase. The continued growth of the Mexican economy has helped all industries, and the Mexican Government expects that the country’s economy will continue to grow in the coming years. The economy was forecasted to continue growing at a rate of 3.5% for 2012. The Mexican Government expects to continue controlling inflation; however, this will probably be the Government’s greatest challenge. The Mexican Government estimates that growth in the coming years will be closely tied to that of the United States, as the United States is Mexico’s principal commercial partner (U.S. Central Intelligence Agency, 2013).

The Government’s promotion of investment in the mineral sector is likely to continue through the Subsecretaría de Minas, which is a Government agency created in 2007 to coordinate and promote the development of the mineral industry in Mexico.

</table>

# Estimated; estimated data are rounded to no more than three significant digits; may not add to totals shown. 
# Table includes data available through January 25, 2013. 
# In addition to the commodities listed, additional types of crude construction materials are produced, but output is not reported, and available information is inadequate to make reliable estimates of output. 
# Primary production of aluminum ceased by the closure of Aluminios y Derivados de Veracruz (Aluder) because of high energy costs. 
# Sb content of antimonial lead. 
# Arsenic content of white arsenic. 
# Refined metal. Bismuth content of impure smelter products no longer reported. 
# Iron ore pellets. 
# Reported by Cámara Nacional del Hierro y del Acero. 
# Includes flat, nonflat, and seamless pipe steel products. 
# Lead content of impure bar, antimonial lead, and refined metal. 
# Includes lead content of antimonial lead. 
# Mostly oxide nodules; includes smaller quantities of direct-shipping carbonates and oxide ores for metallurgical and battery applications. 
# Includes gray and white portland and masonry cement. 
# Reported by Industrias Peñoles, S.A. de C.V. as the only major producer. Includes caustic, electrowet, hydroxide, and refractory. 
# Includes only output used to manufacture fertilizers. 
# Series reflects output reported by Industrias Peñoles, S.A. de C.V. plus an additional 40,000 metric tons of estimated output by other producers. 
# Includes coke made from imported metallurgical coal.
