

2012 Minerals Yearbook

HELIUM

HELIUM

By John E. Hamak¹

Sales of Grade-A helium (99.995% or greater purity) by private industry were 48.0 million cubic meters² (1.73 billion cubic feet) in the United States in 2012, and exports by private producers were 85.0 million cubic meters (3.06 billion cubic feet) for total sales of 133 million cubic meters (4.79 billion cubic feet) of U.S. helium, a slight increase from that of 2011 (table 1). During 2012, domestic helium sales remained steady, and helium exports increased slightly compared with those of 2011.

Legislation and Government Programs

The Helium Privatization Act of 1996, Public Law 104.273, directed the Federal Helium Program to discontinue production and sale of refined helium by April 9, 1998. The Act also directed the Government to offer for sale the helium stored in the Federal helium reserve, in excess of 600 million cubic feet, between January 1, 2005, and January 1, 2015.

The Act called for a National Academy of Sciences (NAS) study to determine the impact of selling the reserve using the pricing mechanism described in the Act. The first study was completed in 1998. Operational problems experienced by the helium plants in Algeria and Qatar during 2005 and the continued increase of helium exports from the United States have had an impact on pricing (helium suppliers increased the price of helium) and availability of cryogenic helium (helium supplies were disrupted), in particular, to the scientific community. During 2009, the NAS initiated a second study to reevaluate the impact of selling the reserve under the existing pricing mechanism to determine whether adjustments were needed that would optimize future availability of helium for its many scientific and industrial uses. The second study was completed in January 2010, and some recommendations by the NAS have been implemented by the U.S. Bureau of Land Management (BLM). One of the more noteworthy recommendations was to increase helium prices by developing a pricing strategy that better reflected market-based helium prices.

The sale and disposal of the Exell Helium Plant in December 2010 completed all closure requirements for helium production by the Federal Government.

Production

In 2012, 10 companies operated 16 privately owned domestic helium plants; an additional 5 plants were idle during the year.

¹Lead General Engineer, Helium Resources Evaluation, U.S. Bureau of Land Management, Amarillo Field Office—Helium Operations, Amarillo, TX.

²All metric helium volumes herein are at 101.325 kilopascals absolute (14.696 pounds per square inch absolute) and 15 °C (59 °F). Helium volumes, reported in parentheses following metric units, are measured in cubic feet at 14.7 pounds per square inch absolute and 70 °F—1,000 cubic feet (14.7 pounds per square inch absolute and 70 °F) equals 27.737 cubic meters (101.325 kilopascals absolute and 15 °C) and 1 cubic meter (101.325 kilopascals and 15 °C) equals 36.053 cubic feet (14.7 pounds per square inch absolute and 70 °F).

Of the 16 operating plants, 10 extracted crude helium from natural gas, and 8 plants produced Grade-A helium. Three of the idle plants were crude helium plants and two were Grade-A helium plants. No new helium plants came online in 2012. All but two extraction plants used cryogenic extraction processes.

Total sales of U.S.-produced helium in 2012 increased slightly compared with those of 2011. All natural gas processed for helium recovery came from gasfields in Colorado, Kansas, Oklahoma, Texas, and Wyoming (figure 1). During 2012, 9 private plants purified helium by using pressure swing adsorption technology. Eight privately owned plants that produced Grade-A helium also liquefied helium. Plant operators and locations are listed in table 2.

Domestic production data for helium were developed by the BLM from records of its own operations as well as from its high-purity helium survey, an annual voluntary canvass of private U.S. operations. Of the eight operations to which a survey request was sent, all responded, and those data plus data from BLM operations represent 100% of the total helium sales and recovery data listed in table 3.

About 5% less helium was produced from the Government's helium reserve at Cliffside field in 2012 than during 2011. Most domestic helium production comes from the Midcontinent and Rocky Mountain regions of the United States. The measured helium reserves from which helium is produced are located in approximately 102 gasfields in 11 States. Most of these reserves are contained in the Hugoton field in Oklahoma, Kansas, and Texas; the Panoma field in Kansas; the Keyes field in Oklahoma; the Panhandle West and Cliffside fields in Texas; and the Riley Ridge area in Wyoming.

During the past 2 years, considerable efforts were focused on digitizing the information in the helium resources database, with the main goal of producing an updated map of helium reserves in the United States by 2014.

Consumption

In 2012, private industry supplied 100% of domestic helium for U.S. consumption. The major domestic end uses of helium were cryogenics (26%), controlled atmospheres (22%), pressurizing and purging (17%), and welding (17%); other uses included chromatography, cryogenics, lifting gas, and magnetic resonance imaging applications dominated liquid helium use. Estimated 2012 domestic consumption by end use was based on revised figures for a 2009 end-use survey conducted by BLM's Helium Operations to determine trends in helium usage.

In 2012, U.S. domestic helium consumption remained unchanged at 48.0 million cubic meters (about 1.73 billion cubic feet) compared with consumption for 2011. During 2012, U.S. helium exports increased slightly to 85 million cubic meters (about 3.06 billion cubic feet), compared with those of 2011 (table 1).

In-kind crude helium sales regulations (43 CFR part 3195) require helium refiners that sell helium to Federal agencies and their contractors to buy an equivalent amount of crude helium from the BLM. In 2012, in-kind crude helium sales were about 4.3 million cubic meters (154 million cubic feet). The sales were made to eight companies through contracts with the BLM.

Stocks

The volume of helium stored in the BLM helium conservation storage system, including the conservation pipeline network and the Cliffside field, totaled about 338 million cubic meters (12.2 billion cubic feet) on December 31, 2012. The storage system contained crude helium purchased under contract by the Government from 1962 to 1973 and privately owned helium extracted by industry from natural-gas-supplying fuel markets and stored under contract. This privately owned helium is returned to the owners as needed for purification to supply private demand. During 2012, 10.4 million cubic meters (376 million cubic feet) of privately owned helium was delivered to the BLM's helium conservation system, and 68 million cubic meters (about 2.4 billion cubic feet) were withdrawn, for a net decrease of 57.6 million cubic meters (2.02 billion cubic feet) of private helium in storage (table 4).

Transportation

Private producers and (or) distributors shipped helium, predominantly as a liquid, in semitrailers, which delivered the liquid helium to distribution centers, where some of it was gasified and compressed into trailers and small cylinders for delivery to end users. The remaining liquid helium was sold as bulk liquid or repackaged in Dewars of various sizes for delivery.

Prices

In fiscal year 2012, the price that the BLM charged private companies for crude helium was \$3.03 per cubic meter (\$84.00 per thousand cubic feet), 12.2% higher than that of 2011. The BLM crude helium price is set by the Helium Privatization Act of 1996 and is adjusted yearly based on the Consumer Price Index for the previous year and costs of the helium program.

Foreign Trade

According to the U.S. Census Bureau, in 2012, exports of Grade-A helium increased to 85.0 million cubic meters (3.06 billion cubic feet), a slight increase compared with those of 2011 and accounted for about 64.0% of sales of U.S.-produced helium; private industry supplied all U.S. helium exports. Regionally, Asia received 47% of the helium exported from the United States; Europe, 26%; North America, Central America, and the Caribbean, combined, 16%; South America, 8%; the Middle East and Africa, combined, 2%; and Australia and New Zealand, combined, 1%. For 2012, import tariffs on helium remained at 3.7% for normal trade relations (NTR) nations and 25% for non-NTR nations.

World Review

Total world production was approximately 173 million cubic meters (about 6.24 billion cubic feet) in 2012. Excluding the United States, world production capacity of helium was estimated to be about 40.0 million cubic meters (1.43 billion cubic feet) in 2012 (table 5). Helium was produced in Algeria, Australia, Poland, Qatar, and Russia. Worldwide, several new helium plant projects were scheduled for startup between 2013 and 2018.

Outlook

From 2007 through 2012, the total global market for U.S. produced helium increased steadily by about 3.5% per year. Owing to the slow U.S. economic recovery, U.S. domestic helium consumption is expected to remain stable during 2013. Because of increased capacity of foreign plants and lower helium production in the United States, exports are expected to decrease during 2013.
