

Metal Industry Indicators

Indicators of Domestic Primary Metals, Steel, Aluminum, and Copper Activity

June 2018

In May, the primary metals leading index and its 6-month smoothed growth rate decreased. Notably, the primary metals leading index 6-month smoothed growth rate turned negative for the first time since February 2016 (table 2). The U.S. nonferrous metal products inventories growth rates have been below the -1.0% threshold, from April 2016 through March 2018 (table 1). Inventory decreases indicate increased consumption in nonferrous metal products. In March 2018, the primary aluminum 6-month smoothed growth rate ended an eighteen month period of positive double digit growth; double digit growth began again April 2018 (table 1). Also in March 2018, the primary copper 6-month smoothed growth rate ended a sixteen month period of positive double digit growth (table 1). The steel scrap 6-month smoothed growth rate had double digit positive growth rates November 2016 through September 2017, paused October and November 2017, and resumed double digit growth rates December 2017 through May 2018 (table 1).

The **primary metals leading index** decreased to 166.3 in May from a downwardly revised 169.5 in April, and its 6-month smoothed growth rate decreased to -0.6% in May from a downwardly revised 3.5% in April (table 2). The 6-month smoothed growth rate is a compound annual rate, which measures near-term trend. Usually, a growth rate above +1.0% signals an increase in metals activity, and a growth rate below -1.0% indicates a downturn in activity. The primary metals leading index growth rate posted growth rates above +1.0% from April 2016 through April 2018, which could signal strength in primary metals industry activity; May 2018 represents a break in the trend. Of the four indicators that were available to calculate the May leading index, the Purchasing Managers' Index [0.2] was the largest positive contribution (table 3). The largest negative contribution was primary metals average weekly hours [-1.5] (table 3). The May leading index should be considered preliminary because only four of its eight indicators were available, and the leading index will be subject to revision when the other components are added next month.

The **steel leading index** decreased to 117.5 in April from an upwardly revised 117.7 in March, and its 6-month smoothed growth rate decreased to 1.1% in April from an upwardly revised 1.5% in March (table 4). The March and April 2018 steel leading index growth rates were above the +1.0% growth rate threshold, which could indicate near-term strength in steel industry activity. In contrast, from December 2017 through February 2018, the steel leading index growth rates were marginally below the +1.0% threshold. The largest positive contribution to the steel leading index in April was iron and steel mills average weekly hours [0.3] (table 5). The largest negative contributions were the S&P stock price index of steel companies [-0.2], the growth rate of the U.S. M2 money supply [-0.2], and the Purchasing Managers' Index [-0.2] (table 5).

The **copper leading index** decreased to 130.9 in April from a downwardly revised 131.1 in March, and its 6-month smoothed growth rate decreased to 2.8% in April from an upwardly revised 3.6% in March (table 6). Since June 2017, the copper leading index growth rate had been above the +1.0% threshold, however, in December, the growth rate turned marginally negative but turned solidly

positive again from January through April 2018 (table 6). The largest positive contributions to the copper leading index in April were the nonferrous metals average weekly hours [0.1], the LME spot price of primary copper [0.1], and the spread between the U.S. 10-year Treasury Note and the federal funds rate [0.1] (table 7). The largest negative contribution was the S&P stock price index of building products companies [-0.3] (table 7).

The **leading index of metal prices** decreased to

107.3 in April from an upwardly revised 108.1 in March, and its 6-month smoothed growth rate decreased to -1.3% in April from an upwardly revised 0.4% in March (table 1). The leading index of metal prices growth rates were above the +1.0% growth rate threshold in January and February 2018, however, it dipped below the +1.0% threshold in March, and fell below the -1.0% threshold level in April 2018, which could signal near term weakness in metal prices (table 1).

Sources: U.S. Geological Survey (USGS), American Metal Market (AMM), the London Metal Exchange (LME), U.S. Census Bureau, the Organisation for Economic Cooperation and Development (OECD), and Federal Reserve Board.

Note: The components of the Leading Index of Metal Prices are the spread between the U.S. 10-year Treasury Note and the federal funds rate, and the 6-month smoothed growth rates of the deflated value of new orders for nonferrous metal products, the Organisation for Economic Cooperation and Development (OECD) Total Leading Index, and the reciprocal of the trade-weighted average exchange value of the U.S. dollar against other major currencies. The Metal Industry Indicators (MII) Nonferrous Metals Price Index measures changes in end-of-the-month prices for primary aluminum, copper, lead, and zinc traded on the London Metal Exchange (LME). The steel scrap price used is the price of No. 1 heavy melting. Inventories consist of the deflated value of finished goods, work in progress, and raw materials for U.S.-produced nonferrous metal products (NAICS 3313, 3314, & 335929). Six-month smoothed growth rates are based on the ratio of the current month's index or price to its average over the preceding 12 months, expressed at a compound annual rate.

Coincident: 1, Federal Reserve Board; 2, Bureau of Labor Statistics and U.S. Geological Survey; and 3, U.S. Census Bureau and U.S. Geological Survey. All series are seasonally adjusted, except 2, 3, and 4 of the leading index.

NA: Not available **r:** Revised

Note: A component's contribution, shown in Tables 3, 5, 7, and 9, measures its effect, in percentage points, on the percent change in the index. Each month, the sum of the contributions plus the trend adjustment equals (except for rounding differences) the index's percent change from the previous month.

CHART 2.

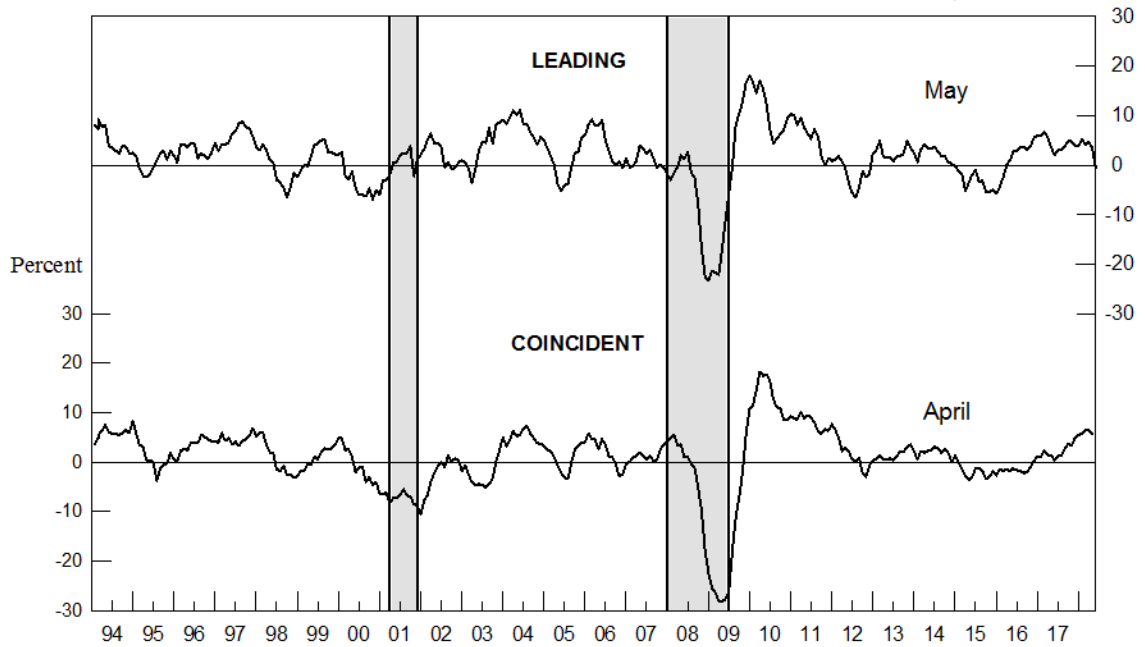

PRIMARY METALS: LEADING AND COINCIDENT INDEXES, 1994-2018 1977=100

Shaded areas are business cycle recessions. Asterisks (*) signify peaks (the end of an expansion) and troughs (the end of a downturn) in the economic activity reflected by the indexes.

CHART 3.

PRIMARY METALS: LEADING AND COINCIDENT GROWTH RATES, 1994-2018 Percent

Shaded areas are business cycle recessions.

The growth rates are expressed as compound annual rates based on the ratio of the current month's index to its average level during the preceding 12 months.

CHART 6.
COPPER: LEADING AND COINCIDENT INDEXES, 1994-2018

CHART 7.
COPPER: LEADING AND COINCIDENT GROWTH RATES, 1994-2018

Explanation

Each month, the U.S. Geological Survey tracks the effects of the business cycle on three U.S. metal industries by calculating and publishing composite indexes of leading and coincident indicators. Wesley Mitchell and Arthur Burns originated the cyclical-indicators approach for the economy as a whole at the National Bureau of Economic Research in the mid-1930s. Over subsequent decades this approach was developed and refined, mostly at the National Bureau, under the leadership of Geoffrey H. Moore.¹

A business cycle can briefly be described as growth in the level of economic activity followed by a decline succeeded by further growth. These alternating periods of growth and decline do not occur at regular intervals. Composite indexes, however, can help determine when highs and lows in the cycle might occur. A composite index combines cyclical indicators of diverse economic activity into one index, giving decision makers and economists a single measure of how changes in the business cycle are affecting economic activity.

The indicators in the metal industry leading indexes historically give signals several months in advance of major changes in a coincident index, a measure of current metal industry activity. Indicators that make up the leading indexes are, for the most part, measures of anticipations or new commitments to various economic activities that can affect the metal industries in the months ahead.

Composite coincident indexes for the metal industries consist of indicators for production, shipments, and total employee hours worked. As such, the coincident indexes can be regarded as measures of the economic health of the metal industries.

The metal industry coincident indexes reflect industry activity classified by the U.S. Standard Industrial Classification (SIC) and the North American Industry Classification System (NAICS). Of the three metal industries, primary metals (NAICS 331) is the broadest, containing 25 different metal processing industries. Steel and copper are specific industries within the primary metals group.

The SIC was the main vehicle used by the U.S. Government and others in reporting industry economic statistics throughout most of the last century. Starting with the 1997 U.S. Economic Census, the U.S. Government began using the NAICS, which classifies economic data for industries in Canada, Mexico, and the United States. From 1997 onward, the metal industry indexes reflect the NAICS classification, while indexes for earlier years follow the SIC.

The largest change to primary metals because of the NAICS deals with other communication and energy wire manufacturing (NAICS 335929). Under NAICS, this manufacturing was removed from primary metals (NAICS 331) and added to electrical equipment, appliance, and component manufacturing (NAICS 3359). In order to maintain consistency with years before 1997, the USGS estimated values for NAICS 335929 and added them to the appropriate metal industry indicators and indexes for the years after 1997.

In May 2016, the Census Bureau benchmarked the 2008-2011 Annual Survey of Manufactures (ASM) to the revised 2012 Economic Census. While the NAICS has been revised since 1997 and was revised for 2012, the ASM follows the 2007 NAICS. For aluminum and nonferrous metals, the result of this benchmark indicates a slightly lower level of

inventories, but no significant contributions for other communication and energy wire.

Because there is no significant contribution to the monthly changes and trend by including estimates of inventories for other communication and energy wire, the USGS will discontinue estimation and including such inventories starting with the June 2016 issue of the Metal Industry Indicators.

The metal industry leading indexes turn before their respective coincident indexes an average of 8 months for primary metals and 7 months for steel and copper.

The leading index of metal prices, also published in the Metal Industry Indicators, is designed to signal changes in a composite index of prices for primary aluminum, copper, lead, and zinc traded on the London Metal Exchange. On average, this leading index indicates significant changes in price growth about 8 months in advance.

The growth rate used in the Metal Industry Indicators is a 6-month smoothed growth rate at a compound annual rate, calculated from a moving average. Moving averages smooth fluctuations in data over time so that trends can be observed. The 6-month smoothed growth rate is based upon the ratio of the latest monthly value to the preceding 12-month moving average:

$$\left(\left(\frac{\text{current value}}{\text{preceding 12-month moving average}} \right)^{\frac{12}{6.5}} - 1 \right) * 100$$

Because the interval between midpoints of the current month and the preceding 12 months is 6.5 months, the ratio is raised to the 12/6.5 power to derive a compound annual rate.

The growth rates measure the near-term industry trends. They, along with other information about the metal industries and the world economy, are the main tools used to determine the outlook of the industries. A 6-month smoothed growth rate above +1.0% usually means increasing growth; a rate below -1.0% usually means declining growth.

The next update for these indexes is scheduled for release on the World Wide Web at 10:00 a.m. EDT, Friday, July 20. The address for Metal Industry Indicators on the World Wide Web is: <http://minerals.usgs.gov/minerals/pubs/mii/>

The Metal Industry Indicators is produced at the U.S. Geological Survey by the National Minerals Information Center. The report is prepared by Jeffrey Busse (703-648-4914; e-mail: jbusse@usgs.gov). Data provided by Jacob Fuhr and Annie Hwang. The former Center for International Business Cycle Research, under the direction of Dr. Geoffrey H. Moore, and the former U.S. Bureau of Mines developed the metal industry leading and coincident indexes in the early 1990s.
