# THE MINERAL INDUSTRY OF NEW HAMPSHIRE

**This chapter has been prepared under a Memorandum of Understanding between the U.S. Geological Survey and the New Hampshire Geological Survey for collecting information on all nonfuel minerals.**

In 2011, New Hampshire's publishable nonfuel mineral production<sup>1</sup> was valued at \$99.7 million, based upon annual U.S. Geological Survey (USGS) data. This was a \$5.2 million (5.5%) increase from the State's total of \$94.6 million in 2010, which followed a \$13.5 million (12.5%) decrease from \$108 million in 2009. However, because data for dimension stone have been withheld to avoid disclosing company proprietary data, the State's actual total nonfuel mineral production values for 2010 and 2011 are higher than those reported in table 1. New Hampshire ranked 48th among the 50 States in nonfuel mineral production value, accounting for slightly more than one-tenth of 1% of the Nation's total nonfuel mineral production value of \$74.7 billion. On a per capita basis, the State ranked 41st with a value of \$76; the national average was \$240.

<sup>1</sup>The terms "nonfuel mineral production" and related "values" encompass variations in meaning, depending upon the mineral products. Production may be measured by mine shipments, mineral commodity sales, or marketable production (including consumption by producers) as is applicable to the individual mineral commodity.

All USGS mineral production data published in this chapter are those available as of May 2013. Data in this report are rounded to three significant digits and percentages are calculated from unrounded data. All USGS Mineral Industry Surveys and USGS Minerals Yearbook chapters—mineral commodity, State, and country—can be retrieved over the Internet at <http://minerals.usgs.gov/minerals>.

In 2010 and 2011, construction sand and gravel and crushed stone continued to be the State's leading nonfuel mineral commodities by value, and accounted for more than 99% of the State's reportable nonfuel mineral production value. In 2011, crushed stone had the largest increase in production value, up by \$6.3 million (16%), and production quantity increased 15% to more than 5 million metric tons (Mt). In 2011, the production value and production quantity of construction sand and gravel decreased by \$1.1 million (2%) and by 354,000 metric tons (t) (5%), respectively. The production value of dimension stone increased by more than 7%, although production quantity was virtually unchanged. In 2010, all mineral commodities produced in the State, except gemstones, decreased in production quantity and production value. Crushed stone had the largest decrease in production value, by \$7.9 million (almost 17%), and production quantity, by 413,000 t (more than 8%). Although construction sand and gravel production quantity decreased by 437,000 t (more than 6%), its production value decreased by \$728,000 (less than 2%). The production quantity and production value of dimension stone decreased in 2010. New Hampshire continued to be a significant producer of dimension stone (granite), ranking 13th and 14th in 2010 and 2011, respectively, among 36 producing States in 2010 and 37 in 2011.
