THE MINERAL INDUSTRY OF NEVADA

This chapter has been prepared under a Memorandum of Understanding between the U.S. Bureau of Mines, U.S. Department of the Interior, and the Nevada Bureau of Mines and Geology for collecting information on all nonfuel minerals.

Nevada, the Nation's leading State in gold and silver production, overall ranked second in 1995 in nonfuel mineral production value, according to the U.S. Geological Survey (USGS). The estimated value for 1995 exceeded $2.9 billion, a decrease of more than 4% from that of 1994. This followed a substantial 9% increase in 1994 from 1993. Nevada mines provided 65% and 46% of the Nation's gold and silver, respectively. Overall, the State accounted for almost 8% of the U.S. total nonfuel mineral production value.

Gold accounted for 86% of Nevada's nonfuel mineral value; industrial minerals, 9%; and silver, copper, and mercury, the remaining 5%. In 1995, a 5% decrease in the estimated value of gold accounted for most of the drop in the State's nonfuel mineral value. Small decreases occurred in the values of construction sand and gravel, lime, and portland cement. In 1994, $200 million gold and $17 million silver value increases fueled a 9% increase in Nevada's nonfuel mineral production value that year (based on final 1994 data). Compared with 1994, the value of the following commodities increased in 1995: silver, diatomite, crushed stone, copper, lithium minerals, industrial sand and gravel, gypsum, bentonite, and gemstones. Decreases occurred in gold, construction sand and gravel, lime, portland cement, barite, magnesite, fuller's earth, perlite, and salt.

Based on USGS estimates of quantities produced in the 50 States during 1995, Nevada remained first in gold, silver, barite, and mercury and the only State having magnesite and brucite production. The State retained its 1994 ranking in a number of other mineral commodities—it was second in diatomite and lithium minerals, fourth in perlite, fifth in gypsum, and eighth in copper. Nevada moved up from seventh to sixth in kaolin clay production. In addition, significant quantities of construction and industrial sand and gravel and lime were produced at mines and manufacturing plants in the State.

According to the Nevada Bureau of Mines and Geology (NBMG), stability in the price of gold during 1995 helped the Nevada gold mining industry sustain high levels of production. Nevada's gold production, more than seven times that of the next highest State, helped bolster the United States' world position as second in gold production. Only South Africa produces more. NBMG stated that the

1Estimated. 2Preliminary. 3Revised. NA Not available. W Withheld to avoid disclosing company proprietary data; value included with "Combined value" data. XX Not applicable.

Production as measured by mine shipments, sales, or marketable production (including consumption by producers).

Data are rounded to three significant digits; may not add to totals shown.

Excludes certain barites; kind and value included with "Combined value" data.

Excludes certain clays; kind and value included with "Combined value" data.

Recoverable content from ores, etc.

Placer canvassing discontinued beginning 1994. May include placer data from other sources.
mining of known reserves should be sufficient to sustain gold production at substantial levels for at least 20 years. According to State officials, the current boom in gold production is unprecedented in U.S. history, both in duration and amount. During the 1990’s, Nevada will have produced more gold than any other state during any gold boom in U.S. history.

The Nevada Division of Minerals (NDM) of the State's Department of Business and Industry conducted a study of the State's active mining and exploration companies and concluded that gold exploration would likely continue at strong levels for the foreseeable future. The survey revealed that new discoveries continue to be made each year, both in established mining districts and in new areas. However, these new ore bodies are often at greater depths, where exploration and mining costs have been higher than average in recent years. Additionally, the study revealed that several current operations are producing substantial amounts of ore from underground rather than the more common open pit mines.

Silver production continued at high levels, chiefly as a byproduct or coproduct of gold. By producing more than three and one-half times as much as the next highest State, Nevada mines helped the State easily retain its nickname of the "Silver State."

Nevada is one of the fastest growing States in the Nation in terms of percentage increase in population. As a result, there is an increasing demand for raw construction materials to fulfill the needs of the expanding population. Production of crushed stone and gypsum (used to make sheetrock or wallboard) continued at relatively consistent levels.

Every February, the NDM, in cooperation with the NBMG, produces a booklet identifying the State's active mining operations. "Major Mines of Nevada" contains a directory of mines that were active the previous year, individual company production and employment statistics, and a series of maps showing the locations of the State's mines, geothermal plants, and petroleum fields. The booklet also includes some analysis of the data. "Major Mines" is supplemented by more complete statistics and analysis in "The Nevada Mineral Industry," a report that NBMG produces each summer. This publication contains an executive summary addressing exploration and production activity for the previous year, complete with numerous charts and graphs. It also includes individual chapters on metals, major precious metal deposits (including discoveries that have not been put into production), industrial minerals, geothermal energy, and oil and gas. This is followed by a directory of mining and milling operations with precise locations and contacts. Both publications are available in paper or in electronic form. The printed publications may be purchased directly from NBMG, or an electronic copy may be obtained for free via the Internet at the NBMG's Home Page on the World Wide Web (http://www.nbmg.unr.edu).

---

1The terms "nonfuel mineral production" and related "values" encompass variations in meaning, depending on the minerals or mineral products. Production may be measured by mine shipments, mineral commodity sales, or marketable production (including consumption by producers) as is applicable to the individual mineral commodity.

All 1995 USGS mineral production data in this chapter are estimates, as of Dec. 1995. For some commodities, especially construction sand and gravel, crushed stone, and portland cement, estimates are updated periodically. To obtain the most recent information please contact the appropriate USGS mineral commodity specialist. Call MINES FaxBack at (703) 648-4999 from a fax machine with a touch-tone handset and request Document No. 1000 for a telephone listing of all mineral commodity specialists or call USGS information at (703) 648-4000 for the specialist's name and number.

2The remaining narrative portion of this report was based on information provided by the NBMG.
