TIN

(Data in metric tons of tin content unless otherwise noted)

**Domestic Production and Use:** Tin has not been mined or smelted in the United States since 1993 and 1989, respectively. Twenty-five firms used about 84% of the primary tin consumed domestically in 2009. The major uses were as follows: cans and containers, 26%; electrical, 24%; construction, 11%; transportation, 11%; and other, 28%. On the basis of the average New York composite price, the estimated values of some critical items in 2009 were as follows: primary metal consumed, $769 million; imports for consumption, refined tin, $824 million; and secondary production (old scrap), $183 million.

**Recycling:** About 12,000 tons of tin from old and new scrap was recycled in 2009. Of this, about 10,000 tons was recovered from old scrap at 2 detinning plants and 84 secondary nonferrous metal processing plants.

**Import Sources (2005-08):** Peru, 47%; Bolivia, 15%; China, 14%; Indonesia, 10%; and other, 14%.

**Tariff:** Most major imports of tin, including unwrought metal, waste and scrap, and unwrought tin alloys, enter the United States duty free.

**Depletion Allowance:** 22% (Domestic), 14% (Foreign).

**Government Stockpile:** On June 4, 2008, the Office of the Undersecretary of Defense suspended tin sales pending further research as a result of the Defense National Stockpile Center (DNSC)’s reconfiguration. As a result of this suspension, the DNSC made no tin sales in calendar year 2009. As of September 30, 2009, DNSC held 4,020 tons of tin in inventory. The fiscal year 2009 Annual Materials Plan (AMP) for tin was set at 6,000 tons and the fiscal year 2010 AMP was set at 4,000 tons. The DNSC inventory was stored in the Hammond, IN, depot and was all “long horn” brand tin. When tin was last offered for sale, it was available via the basic ordering agreement and negotiated sales procedures.

**TIN**

**Events, Trends, and Issues:** Apparent consumption of tin in the United States declined by 17% in 2009 compared with that of 2008. The average monthly composite price of tin generally rose during the year, but, overall, prices in 2009 were substantially lower than those in 2008. Lower prices in 2009 were attributed to decreased demand worldwide owing to the global economic slowdown.

Developments continued in major tin-consuming countries to move to new lead-free solders that usually contain greater amounts of tin than do leaded solders.

Despite the 2009 decline in prices, tin producers continued to respond to the higher tin prices of recent years with tin mine and tin smelter openings and expansions, including ones in Australia, Bolivia, Canada, and Thailand. Tin exploration activity increased, especially in Australia and Canada. In some countries, like Bolivia, old tin tailings were being evaluated for reclamation of tin.

China continued as the world’s leading tin producer from both mine and smelter sources, but experienced sporadic difficulty in obtaining feedstock for its smelters. Indonesia, the world’s second leading tin producer from both mine and smelter sources, continued to experience production difficulties, some related to a Government shutdown of possibly illegal production sites.

**World Resources:** U.S. resources of tin, primarily in Alaska, were insignificant compared with those of the rest of the world. World resources, principally in western Africa, southeastern Asia, Australia, Bolivia, Brazil, China, and Russia, are sufficient to sustain recent annual production rates well into the future.

**Substitutes:** Aluminum, glass, paper, plastic, or tin-free steel substitute for tin in cans and containers. Other materials that substitute for tin are epoxy resins for solder; aluminum alloys, copper-base alloys, and plastics for bronze; plastics for bearing metals that contain tin; and compounds of lead and sodium for some tin chemicals.
