

AT LEAST ROCK'N'ROLL CAN'T GIVE YOU AIDS.

△ AIDS could have you on its hit list. And that doesn't just mean gays. Here it is, once and for all – men and women can and do give the AIDS virus to each other during sex. A man can carry the virus in his sperm, a woman in her vaginal fluid.

They may not know they are infected. And you can't tell. So don't sleep around. From now on, you need to be very sure about someone if you have sex with them.

If in doubt always use a condom. It's safer for both of you. Also on the list is anyone who injects drugs. Using an infected needle is the easiest way to put the virus into your bloodstream. So don't inject. But if you can't stop, never share a needle or equipment.

YOU KNOW WHAT'S IN HIS MIND.

BUT HOW CAN YOU TELL WHAT'S IN HIS BLOOD?

△ Anybody, whether they're male or female, can catch the AIDS virus from ordinary sex.

The disease is incurable and eventually it kills. Up until now, the virus has been confined mainly to small groups of people, but it's spreading all the time.

If a man carries the virus, it's in his sperm. If a woman carries the virus, it's in her vaginal fluid.

The problem is, signs of illness can take years to develop. So, even though over 30,000 people in the UK carry the virus, most of them will look perfectly normal.

But, they can still pass the virus on to other people. With this in mind, suppose a boy shows all the usual signs of fancying you?

Just remember, the more people you have sex with in the future the greater your chances of catching the virus. And apply that rule to this boy as well. If he's had lots of other partners, how can you be sure he's free from infection?

If you're not completely sure about him and you do decide to have sex, insist that he wears a condom. (By preventing his sperm from entering your body, it can help you to avoid infection.)

He may complain that condoms aren't very romantic. But what's so romantic about AIDS?

THE ONE THAT GIVES YOU AIDS.

△ "Your next sexual partner" needn't be the latest in a long line.

He could just as easily be your very first. Even though AIDS has up until now been confined mainly to small groups of people, it's spreading all the time.

Any infected man can pass the AIDS virus to you in his sperm, during ordinary sex. (And likewise, any infected woman can pass the virus to a man in her vaginal fluid.)

So please don't say "It can't happen to me," because it happens to people like you every day.

This doesn't have to mean the death of romance, but

it does mean that in the future you've got to be very careful. The more people you sleep with, the more chance you will have of getting infected.

To reduce the risk to yourself, have as few partners as possible. And if you do have sex with anyone you're not completely sure about, make sure he wears a condom.

If he won't, then don't. It could be the death of you.

For more advice and information, please phone 01-XXX XXXX.

**NOW YOU KNOW WHAT
A TYPICAL AIDS
CARRIER LOOKS LIKE.**

If you're thinking "I'm not gay, so I can't get AIDS," think again. Up until now, AIDS has been confined mainly to small groups of people, but it's spreading all the time. Men and women can and do pass the virus to each other during sex, if one of them is infected. If a man carries the virus, it's in his sperm. If a woman carries it, it's in her vaginal fluid. So in the future, the more sexual partners you have, the greater your chance of catching it. And if you ever have sex with someone you're

not completely sure about, use a condom. (Or make your partner use one.)

A condom can keep both sexes free from infection.

You might find it hard to accept that AIDS could affect your life. But, the more you turn your head away, the more danger you're in.

For more information and advice, telephone 01-XXX XXXX.

**NOW
IT**

**CAN CAUSE
DEATH AS WELL
AS LIFE.**

Next time you have sex, think about what you could be starting. AIDS is incurable and it kills. Up until now it's been confined mainly to small groups of people. But it's spreading all the time.

The virus can be passed on between a man and a woman during ordinary sex, if one of them is infected.

In an infected man, it's in his sperm. In an infected woman, it's in her vaginal fluid.

So in the future, the more people you have sex with, the

greater your chances of catching the virus.

To reduce the risk, sleep with as few people as possible. And if you do have sex with someone you're not completely sure about, always use a condom. (Or make your partner use one.)

Any contraceptive can prevent a new life from starting. But only a condom can prevent your death.

**HOW GAY DO
YOU HAVE TO
BE
TO
CATCH AIDS ?**

You don't have to be gay at all. In fact, the higher you rate your pulling power with women, the more danger you could be in. Up until now, AIDS has been confined mainly to small groups of people, but it's spreading all the time.

If a woman is infected with the AIDS virus, she can pass it to you in her vaginal fluid.

(Likewise, if a man carries the virus, he can pass it on to a woman in his sperm.)

And the more women you have sex with in the future, the

more chance you'll come into contact with one who is infected. If you're into keeping a score, forget it.

Reduce the risk to yourself by having as few partners as possible. And unless you're absolutely sure about your partner, always wear a condom.

That's how careful you have to be to stay alive.

For more information and advice, phone 01-XXX XXXX.

HOW MANY PEOPLE WILL GET IT FOR CHRISTMAS?

△ Every day, more and more people are catching the AIDS virus.

Up until now, it's been confined mainly to small groups of people. But it's spreading all the time.

Men and women can give the virus to each other in ordinary sex if one of them is infected.

If a man carries the virus, it's in his sperm. If a woman carries it, it's in her vaginal fluid.

When you meet someone you fancy at a party or in the pub, just remember this. You can't tell whether someone has the virus just by looking at them.

Many people who have it can walk around for years

before they start looking ill. And during all this time, they can still pass the virus on to you.

So in the future, sleeping around is quite simply risking your life. It's best to have sex with as few people as possible. But if you do have sex with someone you're not completely sure about, always use a condom. (Or make your partner use one). It's safer for both of you.

Christmas is a time for giving. But don't let anyone give you AIDS. For more information and advice, phone 01-XXX XXXX.

HOW STRONG IS YOUR SURVIVAL INSTINCT?

AIDS is incurable and it kills. Answer these questions and find out how likely you are to catch it.

1 Do you believe that AIDS is a problem mainly for junkies and gays?

YES ☐ NO ☐

2 Can you always tell if someone has the AIDS virus just by looking at them?

YES ☐ NO ☐

3 Can you definitely say that you will only have one sexual partner throughout your entire life?

YES ☐ NO ☐

4 Do you think that all forms of contraception protect you from the AIDS virus?

YES ☐ NO ☐

Now, check your answers and see if you could be at risk.

Question 1. Answer 'YES' and you could be at risk. Up until now AIDS has been confined mainly to small groups of people, but it's spreading all the time.

Both men and women can catch AIDS from ordinary heterosexual sex, if one of them is infected.

The man can pass the virus to the woman in his sperm. The woman can pass it on to the man in her vaginal fluid.

AIDS is your problem.

Question 2. Answer 'YES' and you could be at risk.

You cannot tell if someone carries the AIDS virus just by looking at them. Over 30,000 people in the UK now carry it. Most don't show any signs of illness. This is because the illness can take years to develop.

But, anyone who carries the virus can still pass it on. Next time a bloke starts chatting you up, bear this in mind.

Question 3. Answer 'NO' and you could be at risk.

And even if you answer 'YES' you can't always predict the future.

The more boys you sleep with in the future, the greater your chance of catching AIDS.

Question 4. Answer 'YES' and you could be at risk.

Only a condom can protect both of you. It can protect the girl from infected semen and the boy from infected vaginal fluid.

D O N ' T A I D A I D S

DON'T INJECT AIDS

△ Imagine somebody who knows a bit about drugs. Somebody who's smoked, swallowed and snorted most things. But so far, they've never used a needle.

If they do, though, the first needle they use will probably be somebody else's.

At that moment, they'll be in serious danger of catching AIDS.

And sharing a needle or other equipment with someone who carries the AIDS virus is the easiest way to get infected. Now does this somebody sound a bit like you? If it does, don't inject. And never share.

For more information and advice, telephone 01-XXX XXXX.

D O N ' T A I D A I D S

HOW TO STOP YOURSELF DYING FOR SEX.

AIDS is incurable and it kills. Up until now, it's been confined mainly to small groups of people, but it's spreading all the time.

The virus can definitely be passed on during sex between a man and a woman, if one of them is infected.

A woman can catch it from a man's sperm.

A man can catch it from a woman's vaginal fluid.

So in the future, the more sexual partners you have, the more you're at risk.

To reduce the risk, have as few partners as possible. And when you do have sex, remember that only one thing can protect you from infection. A condom.

If you ever have sex with anyone you're not completely sure about, always use one. Because these days, sex can be a matter of life and death.
