| Av. All | 27.33        | .16               | .67                 | -.02                 | 28.14        | 18.84    | 9.12    | .65            | .96    | 1.17         | 1.41          | 32.15         | -4.01             | 6.36         |

\*Farm income includes management income plus value of family labor and interest on investment.

#Not included in averages in any table. Not typical fryer production herd.

The above table shows the main factors of income and expenses for each record in the study with averages for the four high and four low and all records. Each record is given a serial number and they are arranged in descending management income per doe and are kept in the same order in subsequent tables.

The breeding doe is the individual producing unit and total effort should be made to obtain the maximum output at the lowest cost per doe. To get high net income, low producing does and unnecessary costs must be eliminated.

Note the wide variation in income, \$21.43 to \$33.15; also costs \$27.53 to \$40.54. Management income (the payoff) varied from \$4.10 to a loss of \$16.37. Why this great difference?

Subsequent tables will analyze in greater detail these major factors in search for the answer.

TABLE 2.

# PROFITS DEPEND UPON:

## 1. HIGH OUTPUT PER DOE

NUMBER KINDLINGS X NUMBER PER KINDLING - DEATH LOSSES = NUMBER PRODUCED

|             | <u>No. Kindlings</u> | <u>No. Kindled</u> | <u>Death Losses</u> | <u>No. Raised</u> | <u>Management Income</u> |
|-------------|----------------------|--------------------|---------------------|-------------------|--------------------------|
| Record # 1  | 4.3                  | 8.1                | 9.3                 | 25.5              | \$ 4.10                  |
| Record #12  | 4.2                  | 7.2                | 11.9                | 18.3              | -16.37                   |
| Average All | 4.3                  | 7.9                | 9.3                 | 24.7              | - 4.01                   |

## CUT DOWN DEATH LOSSES

## 2. POUNDS OF MEAT SOLD

|             | <u>Number<br/>Produced</u> | <u>Average Weight<br/>Fryers Sold</u> | <u>Total Pounds<br/>Produced</u> |
|-------------|----------------------------|---------------------------------------|----------------------------------|
| Record # 1  | 25.5                       | 4.6                                   | 124.5                            |
| Record #12  | 18.3                       | 4.5                                   | 74.6                             |
| Average All | 24.7                       | 4.4                                   | 111.0                            |

## SAVE THE YOUNG

\*Average number on hand at beginning of each month.

\*\*Breeding programs usually call for 5 kindlings in 12-14 months. Averages may be affected by the mortality and replacement practices, however.

This table analyzes rabbit production and shows the results of certain management practices used by co-operators in this study. Breeding does' statistics are determined by dividing the total of each by the average number of does in the herd during the year.

There is a wide variation in the size of the herd in this study. A family sized operation is usually 200-300 working does or larger, depending on the income requirements of the family. The high profit group averaged larger herds than the low profit group indicating that layer operations are more efficient.

TABLE 3.

# PROFITS WILL DEPEND UPON:

## 1. REDUCING FEED COST — 58.6% of all costs

FEED COSTS = POUNDS OF FEED X PRICE PER CWT.

|             | <u>Pounds</u> | <u>Price per Cwt.</u> | <u>Total Cost</u> | <u>Management Income</u> |
|-------------|---------------|-----------------------|-------------------|--------------------------|
| Record # 1  | 561           | \$3.42                | \$19.16           | \$ 4.10                  |
| Record #11  | 668           | 3.52                  | 23.51             | -15.91                   |
| Average All | 536           | 3.52                  | 18.84             | - 4.01                   |

Reduce Quantity By:      a. Prevent waste — Above and below feed trough  
                                      b. Reduce death losses  
                                      c. Feed only necessary replacements and bucks

Reduce Price By:          a. Buying in quantity  
                                      b. Utilizing low cost feedstuffs

## 2. REDUCE LABOR COSTS — 28.4% of all costs

LABOR COSTS = NUMBER OF HOURS X RATE PER HOUR

|             | <u>Hours</u> | <u>Rate</u> | <u>Total</u> |
|-------------|--------------|-------------|--------------|
| Record # 1  | 8.3          | \$ .75      | \$ 6.20      |
| Record #11  | 15.6         | .75         | 11.70        |
| Average All | 12.2         | .75         | 9.12         |

USE LABOR SAVING DEVICES — GOOD LAYOUT —  
 REDUCE DEATH LOSSES

TABLE 3. ANALYSIS OF LABOR AND FEED COSTS, SALES AND PRICES

\* Feed converted to a pellet equivalent on the basis of total digestible nutrients. Conversion factors used: Grain 123, Manna and other supplemental feed 125, Pellets 100, Greens 23, Hay 78. By doing this, more accurate comparisons may be made between different types of feeding practices.

\*\* Pellet equivalent

TABLE 4.

# THE PAYOFF:-

POUNDS OF MEAT X PRICE PER POUND - COSTS PER POUND = PROFITS

|             | <u>Income per Lb.</u> | <u>Costs per Lb.</u> | <u>Management Income</u> | <u>Farm Income</u> |
|-------------|-----------------------|----------------------|--------------------------|--------------------|
| Record # 1  | 25.3¢                 | 22.0¢                | 3.3¢                     | 8.9¢               |
| Record #12  | 29.2                  | 51.1                 | -21.9                    | -2.9               |
| Average All | 24.6                  | 28.2                 | - 3.6                    | 5.8                |

Costs per pound can be reduced by:

1. High output per unit (doe)

- a. Total fixed cost - Divided over more units
- b. Reducing death losses - Live ones pay cost of dead ones
- c. Culling out non-producing stock

2. Efficient feeding

- a. Use balanced rations
- b. Buy in quantity
- c. Prevent waste - Feed on the ground does not fatten rabbits  
Feed eaten by culls is wasted

3. Save labor

- a. Good layout
- b. Labor-saving devices

4. Good management practices

## EVERY INPUT AND COST SHOULD BE TESTED BY:

WILL IT PAY?

WILL INCREASED YIELDS MORE THAN COVER THE COST?

TABLE 4. ANALYSIS OF COSTS, SALES AND INCOME PER POUND OF MEAT PRODUCED

\* Includes fur, pelts, manure, sacks, and change in stock inventory.

This study on costs, returns and management practices was conducted in cooperation with 13 cooperating rabbit producers in Los Angeles County in the calendar year, 1949. The analyses shown in these tables represent only the records of these rabbitries as reported by the cooperators and is not intended to represent the industry.
