St. Andrews Soft White Winter Wheat - *Preliminary Data*

1. Grain yield in the 2013 St. Andrews soft white winter wheat trial averaged 53 bushels/acre, equal to the 5-year average for this location. The St. Andrews nursery was located about 7 miles west of the town of Coulee, WA (L. Tannenberg, Cooperator).
 2. This nursery was seeded on 4 September, 2012 following fallow. Seed was placed at a 50#/acre seeding rate using a deep-furrow plot drill set on 15-inch spacing. Base fertilizer was 50#N/acre pre-plant applied. Fall seeding conditions produced good emergence and stand establishment.
 3. Yields ranged from 25 to 71 bushels/acre. All yield values within the 10% LSD range of the highest yield are shown in bold and this included 8 of the 47 entries in this trial. The WSU variety `Eltan' was the highest yielding named entry in the trial and tied with `Otto' and `Xerpha' as highest yielding in the 5-year average at this site. There was moderately severe snow mold incidence and stand loss for susceptible varieties at this location. Snow mold stand assessment can be found on a separate table. Snow mold stand losses contributed to higher CV's at this location, but a wide range in agronomic values produced high probabilities of differences among entries. It is also probable that some plants at this site experienced damaging frost. There was a low amount of stripe rust potential at this location and fungicide was applied once with the herbicide application.
- Test weights averaged 58.8 lbs./bu and ranged from 52.4 to 63.4 lbs./bu. Grain protein averaged 12.4% with a range of 10.5 to 14.3%. Plant height averaged 32 inches and there was no lodging
