

# Full Stack Web Developer Syllabus

---

## Contact Info

While going through the program, if you have questions about anything, you can reach us at [support@udacity.com](mailto:support@udacity.com). For help from Udacity Mentors and your peers visit the Udacity Classroom.

## Nanodegree Program Info

The goal of the Full Stack Web Developer Nanodegree program is to equip learners with the unique skills they need to build database-backed APIs and web applications. A graduate of this program will be able to: Design and build a database for a software application Create and deploy a database-backed web API (Application Programming Interface) Secure and manage user authentication and access control for an application backend Deploy a Flask-based web application to the cloud using Docker and Kubernetes

### Prerequisite Skills

A well-prepared learner is able to:

- Write and test software with Python or another object-oriented programming language
- Query a SQL database using SELECT
- Write to a SQL database using INSERT
- Fetch and display data from an API using AJAX or Fetch
- Organize data using JSON (JavaScript Object Notation)

### Required Software

- Python 3.6
- pip
- GIT 2.23 or latest
- Code Editor
- PostgreSQL, Psycopg2
- Kubernetes, Kubectl
- Flask-sqlAlchemy
- AWS CLI
- EKSCTL
- Docker
- Heroku Account
- Gunicorn Webserver

- jose node
- ionic

**Version:** 2.0.0

**Length of Program:** 107 Days\*

*\* This is a self-paced program and the length is an estimation of total hours the average student may take to complete all required coursework, including lecture and project time. Actual hours may vary.*

## Part 1: Welcome to the Program!

## Part 2: SQL and Data Modeling for the Web

In this part, you'll be building out the data models and database for an artist/venue booking application. The fictitious startup Fy-yur is building a website that facilitates bookings between artists who can play at venues, and venues who want to book artists.

### **Project: Fyyur: Artist Booking Site**

In this project, you'll demonstrate your new SQL and data modeling skills by creating a site to help coordinate bookings between artists and venues.

### **Supporting Lessons**

Lesson	Summary
<b>Course Introduction</b>	Understand what this course will cover and the learning objectives achieved.
<b>Interacting with Databases</b>	Interact with relational databases. Review SQL and the Client-Server Model. Use Postgres, understand DBAPIs, and use psycopg2.
<b>SQLAlchemy Basics</b>	Learn to use SQLAlchemy and SQLAlchemy ORM to work with a relational database in Python.
<b>SQLAlchemy ORM in Depth</b>	Get to know Model.query and the SQLAlchemy Object Lifecycle to master how to query for and change records in a database.
<b>Build a CRUD App with SQLAlchemy - Part 1</b>	Build out the ability to read and create todo items in our To-do app, handling changes from the database to the views.
<b>Migrations</b>	Handle changes to your database schema over time using a version control system involving migration files.
<b>Build a CRUD App with SQLAlchemy ORM - Part 2</b>	Finish developing our To-Do app with update and delete functionality. Model relationships with To-Do lists.

## Part 3: API Development and Documentation

In this part, you will use the skills you've developed to build a Trivia API. The goal of this project is to use APIs to control and manage a web application using existing data models. You'll be given a set of data models and the application front end. Your task will be to implement the API in Flask to make the Trivia game functional.

### Project: Trivia API

In this project, you'll use your new API and API documentation skills to build a trivia API.

### Supporting Lessons

## Lesson

## Summary

---

### Introduction to APIs

In this lesson, you'll learn what APIs are, how they're implemented, and why they're important. We'll also dive into the concepts of Internet Protocols and REST.

---

### HTTP and Flask Basics

In this lesson, you'll learn about HTTP—including methods, requests, responses and status codes— as well as how to set up a Flask app, and implement and test endpoints using Curl.

---

### Endpoints and Payloads

In this lesson, you'll learn about how Flask is extensible in itself to handle different kinds of methods, more complex endpoints, and to return formatted data to the client.

---

### API Testing

This lesson teaches students the benefits and purposes of testing an API, Test-Driven Development for APIs and implementing the tests using unittest.

---

### API Documentation

To round out the course, students will consider and write API documentation and project documentation so their projects can be hosted, shared, and used by other developers with clarity.

---

## Project: Improve Your LinkedIn Profile

Find your next job or connect with industry peers on LinkedIn. Ensure your profile attracts relevant leads that will grow your professional network.

## Part 4: Identity and Access Management

In this part, you will build the backend for a coffee shop application. You'll add user accounts and authentication to your application and use role-based access management strategies to control different types of user behavior in the app.

### Project: Coffee Shop Full Stack

In this project, you'll demonstrate your new authentication and authorization skills by creating a full-stack application for a coffee shop menu.

### Supporting Lessons

Lesson	Summary
<b>Foundation</b>	Set the groundwork for understanding information security and refresh your understanding of the technologies used in future lessons.
<b>Identity and Authentication</b>	Explore frequently used methods of identifying who is making requests on web systems. Implement modern software patterns to accomplish this goal across the stack.
<b>Passwords</b>	Understand and overcome common pitfalls of the ubiquitous password authentication design pattern.
<b>Access and Authorization</b>	Limit access to specific resources or actions by restricting requests only to authorized request to particular users and groups of users. Implement role-based access controls (RBAC) across the stack.
<b>Thinking Adversarially</b>	Stay one step ahead of attackers by implementing a secure development process and knowing how to keep informed on the cutting edge of security research.

## Part 5: Server Deployment, Containerization and Testing

### Project: Deploy Your Flask App to Kubernetes Using EKS

#### Supporting Lessons

Lesson	Summary
<b>Introduction</b>	Welcome to the Server Deployment, Containerization, and Testing course!
<b>Containers</b>	An introduction to containers and Docker
<b>Deployment</b>	

### Project: Optimize Your GitHub Profile

Other professionals are collaborating on GitHub and growing their network. Submit your profile to ensure your profile is on par with leaders in your field.

## Part 6: Capstone Project

You will now combine all of the new skills you've learned and developed in this course to construct a database-backed web API with user access control. You will choose what app to build and then you'll design and build out all of the API endpoints needed for the application and properly secure them for use in any front end application (web or mobile).

## Project: Capstone Project

### Supporting Lessons

#### Lesson

#### Summary

---

#### Capstone Prep and Deployment

In this lesson you'll be introduced to the Capstone project and Heroku, a new tool you'll use to deploy your API.
